

# Effectiveness of COVID-19 vaccines against Omicron

For up to 10 months after full vaccination (no booster)

All Canada-approved vaccine types

So far, studies are showing that those who are fully vaccinated might be less protected against Omicron compared to how well they are protected against all strains of COVID-19.

We are waiting for results from more studies to see if protection against Omicron is truly weaker.

In the meantime, preliminary results suggest that booster doses may help increase protection against Omicron. We are waiting for more results to see if booster doses might in fact help “boost” protection against Omicron.
