

## COVID-19 Living Evidence Synthesis #6

(Version 9: 16 June 2021)

### Question

What is the efficacy and effectiveness of available COVID-19 vaccines for variants of concern?

### Findings

We present in Table 1 the key findings about vaccine effectiveness in variants of concern (VOC). Five studies have been added since the previous edition of this living evidence synthesis, all of which are signaled by a last-updated date of 16 June 2021 (highlighted in yellow). New studies for VOC: Alpha [B.1.1.7] (5), Beta [B.1.351] (1), Gamma [P.1] (1).

**Overall**, we have moderate certainty evidence that BNT162b2 [Pfizer] prevents infection from VOC Alpha (46 to 97%) and Beta (22 to 96%) and prevents severe disease from VOC Alpha (92 to 98%). There is preliminary evidence that it protects against infection from VOC Delta (33 to 88% - 1 Obs).

We have moderate certainty evidence that mRNA-1273 [Moderna] prevents infection from VOC Alpha (-9.7 to 100%) and low certainty evidence that it prevents infection from VOC Beta (61 to 96% - 1 Obs).

We have moderate certainty evidence that ChAdOx1nCoV-19 [AstraZeneca] prevents infection from VOC Alpha (65 to 74%) and moderate certainty evidence that it does not prevent infection from VOC Beta (-77 to 55% - 1 RCT). There is preliminary evidence that it protects against infection from VOC Delta (19 to 77% - 1 Obs).

### **Box 1: Our approach**

We retrieved candidate studies and updates to living evidence syntheses on vaccine effectiveness using the following mechanisms: 1) PubMed via COVID-19+ Evidence Alerts; 2) systematic scanning of pre-print servers; 3) updates to the COVID-END inventory of best evidence syntheses; and 4) cross-check with updates from the VESPa team. Each version will include studies and updates to living evidence syntheses identified up to two days before the version release date.

We include studies with clinical outcomes (whether the vaccines prevent infection, severe disease, death, and prevent transmission) and exclude studies that capture only antibody responses. As to the relevance to VOC, we include studies where direct measures are reported, or where reasonable assumptions can be made about the variants prevalent in the jurisdiction at the time of the study.

A full list of studies included, under appraisal, or excluded as non-contributory, is provided as **Appendix 1**.

We extract data from each study in duplicate (McMaster University and University of Ottawa) using the template provided in **Appendix 2**.

We critically appraise each study in duplicate using a simplified version of the ROBINS-I tool as described in **Appendix 3**. The lower the ROBINS-I score, the higher the study quality.

We summarize the evidence by presenting narrative evidence profiles across studies, with or without pooling as appropriate, and rating our confidence in the effect using the GRADE approach for treatment effect (5 domains to downgrade, 3 to upgrade), starting at low confidence for observational evidence. A more detailed explanation of the narrative summary statement is provided in **Appendix 4**.

We update this document every Friday and post it on the COVID-END website. The McMaster/BMJ team maintaining a living evidence synthesis about vaccine efficacy will use our extracted data in their meta-analyses, GRADE assessments, and guideline development. We will incorporate their findings as they become available.

We have moderate certainty evidence that Johnson & Johnson prevents infection from VOC Beta (52 to 64% - 1 RCT).

We have moderate certainty evidence that NVX-Co2373 [Novavax] prevents infection from VOC Alpha (71 to 94% - 1 RCT) and VOC Beta (-9.8 to 70% - 1 RCT).

Overall, 69 studies were appraised and 36 used to complete this summary. The reasons for excluding the remaining 33 studies are reported in Appendix 2

Methods are presented in Box 1 and Appendices 1-5.

**Table 1: Key findings about vaccine effectiveness**

Vaccine	Effectiveness	Findings
Pfizer	Overall	<a href="#">Compared to placebo, vaccination with BNT162b2 probably reduces the incidence of symptomatic cases of COVID-19 substantially, although there remains uncertainty about the impact of reducing mortality or severe disease. The evidence shows that it may slightly increase the incidence of serious adverse events, and it probably increases the incidence of any adverse event.</a> Review of RCTs (AMSTAR 10/11); <i>last search date</i> 2021-06-14; GRADE evidence profile updated on 2021-06-10

Pan American Health Organization/World Health Organization.Pharmacovigilance for COVID-19 Vaccines. <https://covid-19pharmacovigilance.paho.org>

Iorio A, Little J, Linkins L, Abdelkader W, Bennett D, Lavis JN. COVID-19 living evidence synthesis #6 (version 6.9): What is the efficacy and effectiveness of available COVID-19 vaccines in general and specifically for variants of concern? Hamilton: Health Information Research Unit, 16 June 2021.

The COVID-19 Evidence Network to support Decision-making (COVID-END) is supported by an investment from the Government of Canada through the Canadian Institutes of Health Research (CIHR). To help Canadian decision-makers as they respond to unprecedented challenges related to the COVID-19 pandemic, COVID-END in Canada is preparing rapid evidence responses like this one. The opinions, results, and conclusions are those of the evidence-synthesis team that prepared the rapid response, and are independent of the Government of Canada and CIHR. No endorsement by the Government of Canada or CIHR is intended or should be inferred.

## Appendix 1: Reference list

Section 1: included studies				
Ref	Author	Bottom line	ROBINS-I*	Design, Notes
*Note: ROBINS-I score risk of bias: Low risk of bias indicates high quality				
1	<a href="#">Dagan</a>	BNT162b2 showed the same VE as the phase III trial (46-60% 14 days after 1 <sup>st</sup> dose and 92% 7 days after 2 <sup>nd</sup> dose) in a population with an estimated circulation of Alpha. up to 80% against any infection.	Moderate	Cohort Israel, .5 M matched; large population, KM, concordant with trial; 2 M excluded (possible overlap with Haas)
2	<a href="#">Haas</a>	BNT162b2 showed the same VE as the phase III trial (91% [ $>7$ days] and against asymptomatic infections [94%], hospitalization [98%] and death [98%], respectively, 14 days after 2 <sup>nd</sup> dose in a population with 94% of Alpha.	Moderate	Cohort Israel, concordant with trial; effect on death (possible overlap with Dagan) Updated May 14 due to final publication
3	<a href="#">Kustin</a>	BNT162b2 showed lower relative VE (2.4:1) against Alpha. after 1 <sup>st</sup> dose; and lower VE (8:1) against Beta after 2 <sup>nd</sup> dose in a population with $>90\%$ of Alpha and $<1\%$ B.1.135.	Moderate	Case-control Israel, asymmetry in VOC; small sample for Beta (no overlap, CHS cohort).
4	<a href="#">Madhi</a>	Two doses of the ChAdOx1 nCoV-19 vaccine had no efficacy against the Beta variant in preventing mild to-moderate Covid-19.	Moderate quality (RCT)	RCT South Africa; VE 20% in seronegative and 10% in seropositive – 75% (95% CI, 9 to 95) after 1 dose before emergence of variant. Underpowered for 20% efficacy (42 cases)
5	<a href="#">Emery</a>	ChAdOx1nCoV-19 (two doses) VE against the Alpha variant was 70.4% (95% CI, 43.6 to 84.5) for Alpha and 81.5% (95% CI, 67.9 to 89.4) for non-Alpha.	Moderate quality (RCT)	RCT; UK; neutralization of Alpha 9 times lower; no sequencing for 45% of cases; 52 cases (19%) had Alpha variant
6	<a href="#">Shah</a>	ChAdOx1nCoV-19 or BNT162b2 reduced infection in household contacts of vaccinated HCW by about 30% (HR, 0.70, 95% CI, 0.64 to 0.78) $\geq 14$ days after 1 <sup>st</sup> dose; ChAdOx1nCoV-19 or BNT162b2 reduced infection in HCW by about 55% (HR 0.45, 95% CI, 0.42 to 0.49) and hospitalization by 84% (HR 0.16, 95% CI, 0.09 to 0.27) $\geq 14$ days after 1 <sup>st</sup> dose	Moderate	Observational Scotland - (25% of cases had received 2 doses)
7	<a href="#">Sadoff</a>	For Ad26.COV2.S, VE was 66.9% (95% CI, 59.0 to 73.4) at 14 days and 66.1% (95% CI, 55.0 to 74.8) at 28 days against any infection. For severe cases, VE was 76.7% (95% CI, 54.6 to 89.1) at $\geq 14$ days	Moderate quality (RCT)	RCT (~40,000) Argentina, Brazil, Chile, Colombia, Mexico, Peru, South Africa,

		and 85.4% (95% CI, 54.2 to 96.9) at $\geq 28$ days). VE against VOC Beta was 52.0% and 64.0% at 14 days and 28 days, respectively, and 73.1% for moderate cases and 81.7% for severe cases.		and the United States; 86 of 91 cases sequenced for VOC Beta
8	<a href="#">Andrejko</a>	BNT162b2 or mRNA-1273 VE was 58.9% (95% CI, -9.7 to 84.5) at 15 days after 1 dose, and 85.7% (95% CI, 67.2 to 93.9) 15 days after 2 dose against any infection.	Moderate	Observational test-negative, case-positive random sampling matched control study. 69% of population at time had variants Alpha., Epsilon
9	<a href="#">Glampton</a>	ChAdOx1nCoV-19 or BNT162b2 showed VE 74% (HR 0.26, 95% CI, 0.19 to 0.35) and 78% (HR 0.22, 95% CI, 0.18 to 0.27), respectively, 28 days after first vaccination dose against any infection.	Moderate	Observational retrospective cohort, 2 M eligible for population; 389,587 vaccinated (58% Pfizer, 42 AZ); variants not assessed, but dominant being Alpha at that time.
10	<a href="#">Pritchard</a>	ChAdOx1nCoV-19 or BNT162b2 showed VE of 65% (95% CI, 60 to 70%) 21 days after first dose and 70% (95% CI, 62 to 77%) after second dose against any infection. No difference between vaccines or versus people with previous infection. Same effect for Alpha (dominant) or not Alpha.	Moderate	Observational prospective testing; 370,000 participants, 1.6 M tests infections with evidence of high viral shedding Ct<30 (88% reduction after two doses; 95% CI 80 to 93%; P<0.001) and with self-reported symptoms (90% reduction after two doses; 95% CI 82 to 94%; P<0.001)
11	<a href="#">Hall (SIREN)</a>	BNT162b2 vaccine showed VE of 70% (95% CI, 55 to 85) 21 days after 1 <sup>st</sup> dose and 85% (95% CI, 74 to 96) 7 days after two doses in the study population against any infection.	Moderate	Prospective cohort with standardized testing and adjustment for confounders, HCW, all of England; 23,000 participants, 46 years of age, 84% females.
12	<a href="#">Shrotri</a>	Similar effect sizes were seen for ChAdOx1 (aHR 0.32, 95% CI, 0.15 to 0.66) and BNT162b2 (aHR 0.35, 95% CI, 0.17 to 0.71) at 35-48 days.	Low	Prospective cohort in England: 9160 of 10412 frail LTC residents (median 86 years of age), 66% Pfizer, 33% AZ. Routine screening.
13	<a href="#">Hyams</a>	1 <sup>st</sup> BNT162b2 showed VE 71.4% (95% CI, 43.1 to 86.2). ChAdOx1nCoV-19 1 <sup>st</sup> dose VE 80.4% (95% CI, 36.4 to 94.5) against hospitalization for 80+ 14 days after 1 <sup>st</sup> dose. When effectiveness analysis for BNT162b2 was restricted to the period covered by ChAdOx1nCoV-19, the estimate was 79.3% (95% CI, 47.0 to 92.5).	Moderate	Test negative case control, Scotland. Single center, 466 participants, 80+ (median age 86). Adjusted/matched Cox

14	<a href="#">Harris</a>	First dose of BNT162b2 or ChAdOx1 (21 days prior) reduced likelihood of transmission by 40-50% for household contacts of HCW	Moderate	Data-linkage and case-control in England; 338,887 participants; will have missed asymptomatic infection
15	<a href="#">Goldberg</a>	Prior infection (in unvaccinated) has similar VE against any infection [94.8%], and severe illness [96.4%] as two doses of BNT162b2	Moderate	Individual-level population database in Israel; 6,351,903 participants; likely overlaps with Dagan and Haas
16	<a href="#">Cavanaugh</a>	VE against infection was 66.2% (95% CI, 40.5% to 80.8%) among residents and among HCP was 75.9% (95% CI, 32.5% to 91.4%). VE against hospitalization was 94.4% (95% CI, 73.9% to 98.8%) among residents; no HCP were hospitalized. Three residents died, two of whom were unvaccinated (VE = 94.4%; 95% CI, 44.6% to 99.4%).	Serious	Outbreak analysis; small sample size
17	<a href="#">Shinde</a>	NVX-CoV2372 VE showed VE 50.4% (95% CI, 16.6 to 70.5) against symptomatic infection 7 days after 2 <sup>nd</sup> dose	Moderate quality (RCT)	RCT; 4387 participants 38/41 cases Beta
18	<a href="#">Hitchings</a>	One dose of CoronaVac showed VE of 35.1% (95% CI, -6.6 to 60.5) against infection in HCW	Serious	53,176 HCW in Manaus 75% prevalence of Gamma; 776 (28%) of 2797 PCR were used for the case-controls; infection increased in the first 13 days (Healthcare seeking behaviour, differential test seeking); rate of previous infection high in the population
19	<a href="#">Heath</a>	Two doses of NVX-CoV2373 showed VE 89.7% (95% CI, 80.2 to 94.6) against any infection. No hospitalizations or deaths in vaccinated group.	Moderate quality (RCT)	RCT; 15,187 participants in UK Post hoc: VE 86.3% (95% CI, 71.3 to 93.5) against Alpha variant; 10 cases in vaccinated participants; 66 infections confirmed Alpha; 11 infections no sequence available
20	<a href="#">Ismail</a>	Two doses of BNT162b2 or ChAdOx1 showed VE 80% (95% CI, 74 to 85) against hospitalization 28 days after 1 <sup>st</sup> dose and 92% (95% CI, 87 to 95%) 14 days after 2 <sup>nd</sup> dose for people 80+.	Moderate	Screening study of 13,907 hospitalized patients in UK; results for age 80+ also reported separately according to vaccine
21	<a href="#">Bernal (2)</a>	BNT162b2 reduced risk of death in 70+ by 44% (95% CI, 32 to 53) after 1 <sup>st</sup> dose and by 69% (95% CI, 31 to 86) after 2 <sup>nd</sup> dose; single dose ChAdOx1 reduced risk of death by 55% (95% CI, 41 to 66)	Moderate	48,096 cases above age 70+ in England; linked to mortality database; 12.7% BNT162b2 and 8.2% ChAdOx1
22	<a href="#">Chodick</a>	BNT162b2 showed VE 94% (95% CI, 88 to 97) against infection 7-27 days after 2 <sup>nd</sup>	Moderate	Health care organization in Israel – 1,178,597 participants; compared time frames to

		dose; 71% (95% CI, 37 to 87) in immunosuppressed		estimate effectiveness against Alpha
23	<a href="#">Chung</a>	BNT162b2 or mRNA-1273 showed VE 61% (95% CI, 56 to 66) against symptomatic infection by Alpha 14 days after 1 <sup>st</sup> dose and 90% (95% CI, 85 to 94) 7 days after 2 <sup>nd</sup> dose; 43% (95% CI, 22 to 59) against symptomatic infection by Beta or Gamma 14 days after 1 <sup>st</sup> dose and 88% (95% CI, 61 to 96) 7 days after 2 <sup>nd</sup> dose.	Serious	Test-negative study in Ontario 324,033 participants; limitations in symptom collection; screening for variants started 2 months into study period; results also reported for age>70
24	<a href="#">Bailly</a>	BNT162b2 showed VE 50% (95% CI, 34 to 73) against infection with Beta >28 days after 2 doses	Moderate	Outbreak in a single LTC in France, 90 participants, all samples genome sequenced; 2 deaths in vaccinated group
25	<a href="#">Angel</a>	BNT162b2 showed VE 97% (95% CI, 94 to 99) against symptomatic infection and 86% (95% CI, 69 to 93) against asymptomatic infection $\geq$ 7 days after 2 doses in HCW	Moderate	Retrospective cohort at a single centre tertiary medical centre in Israel, 6,710 participants; testing strategy was different between vaccinated and unvaccinated
26	<a href="#">Bianchi</a>	BNT162b2 showed VE 61.9% (95% CI, 19.2 to 82) against infection 14 to 20 days after 1 <sup>st</sup> dose; 96% (95% CI, 82.2 to 99.1) $\geq$ 7 days after 2 <sup>nd</sup> dose in HCW	Moderate	Data-linkage, single centre medical centre in Italy, 2,034 participants; VOC Alpha
27	<a href="#">Yassi</a>	BNT162b2 (93%) or mRNA-1273 showed VE 37.2% (95% CI, 16.6 to 52.70) against infection by Beta or Gamma 14 to 42 days after 1 <sup>st</sup> dose and 79.2% (95% CI, 64.60 to 87.80) 7 days after 2 <sup>nd</sup> dose	Low	Data-linkage, 25,558 Canadian HCW; evenly split between VOC Gamma and VOC Beta by end of study period
28	<a href="#">Bernal (1)</a>	BNT162b2 reduced risk of infection by confirmed variant Alpha OR 0.40 (95% CI, 0.27 to 0.60) at least 28 days after 1 <sup>st</sup> dose and OR 0.10 (95% CI, 0.06 to 0.16) at least 14 days after 2 <sup>nd</sup> dose for people 70+	Moderate	Test-negative in England, 156,930 participants
29	<a href="#">Bernal (3)</a>	BNT162b2 or ChAdOx1 reduced risk of symptomatic infection by confirmed variant Delta VE 33.5% (95% CI, 20.6 to 44.3) compared to confirmed variant Alpha 51.1% (95% CI, 47.3 to 54.7) at least 21 days after 1 <sup>st</sup> dose. BNT162b2 and ChAdOx1 reduced risk of symptomatic infection by confirmed variant Delta VE 87.9% (95% CI, 78.2 to 93.2) and VE 59.8% (95% CI, 28.9 to 77.3), respectively, at least 14 days after 2 <sup>nd</sup> dose.	Moderate	Test-negative; 12,675 sequenced cases: 11,621 Alpha and 1,054 Delta. Positive cases after 1 or 2 doses were more likely to be due to variant Delta (OR 1.40, 95% CI, 1.13 to 1.75)
30	<a href="#">Ranzani</a>	CoronaVac reduced risk of symptomatic infection by variant of concern Gamma VE 41.6% (95% CI, 26.9	Moderate	Test-negative in Brazil; 44,055 participants; sequencing not performed; effectiveness declined with age; VOC Gamma

		to 63.3) $\geq$ 14 days after 2 <sup>nd</sup> dose for people 70+.		
31	<a href="#">Andrejko (2)</a>	BNT162b2 and mRNA-1273 showed VE 86.8% (95% CI, 68.6 to 94.7) and VE 86.10% (95% CI, 69.1 to 93.9), respectively, against any infection 15 days after 2 <sup>nd</sup> dose.	Moderate	Test-negative in California; 1,023 participants; expansion of sample size and timeline since previous study by same authors; self-reported vaccine receipt. VOC Alpha, Epsilon
32	<a href="#">Emborg</a>	BNT162b2 showed VE 53-86% against infection across high-risk groups, VE 75-87% against hospitalization across high-risk groups, VE 89% (95% CI, 81 to 93) against death in LTCF residents and VE 97% (95% CI, 88 to 99) against death in 65+ requiring personal care 7 days after 2 <sup>nd</sup> dose.	Moderate	Data-linkage population study of high-risk groups in Denmark; 864,096 participants; VOC Alpha
33	<a href="#">Salo</a>	BNT162b2 showed VE 42.9% (95% CI, 22.3 to 58.1) against infection in unvaccinated household members of vaccinated HCW 10 weeks after 2 <sup>nd</sup> dose.	Moderate	Data-linkage for household contacts of HCW in Finland; 52,766 spouses of vaccinated HCW; VOC Alpha
34	<a href="#">Shrestha</a>	BNT162b2 and mRNA-1273 showed VE 97.1% (95% CI, 94.3 to 98.5) against any infection $\geq$ 14 days after 2 <sup>nd</sup> dose (based on multivariable model)	Low	Retrospective cohort of employees of a health care system in Ohio; 46,866 participants (60%) vaccinated by end of study; VOC Alpha
35	<a href="#">Skowronski</a>	BNT162b2 (85%) and mRNA-1273 showed overall VE 65% (95% CI, 58 to 71) against any infection $\geq$ 21 days after 1 <sup>st</sup> dose for 70+: VE 67% (95% CI, 57 to 75) against any infection by VOC Alpha and VE 61% (95% CI, 45 to 72) against any infection by VOC Gamma	Moderate	Test-negative in Canada; 16,993 specimens; out of 1,131 genetically sequenced: 45% VOC Alpha and 28% Gamma; limitations in symptom collection and assessment for covariates
36	<a href="#">Abu-Raddad</a>	BNT162b2 showed VE 89.5% (95% CI, 85.9 to 92.3) against any infection, VE 100% (95% CI, 81.7 to 100) against any severe, critical, or fatal disease by VOC Alpha $\geq$ 14 days after 1 <sup>st</sup> dose; BNT162b2 showed VE 75% (95% CI, 70.5 to 78.9) against any infection, VE 100% (95% CI, 73.7 to 100) against any severe, critical, or fatal disease by VOC Beta $\geq$ 14 days after 1 <sup>st</sup> dose;	Moderate	Test-negative in Qatar; 17,293 cases; sequencing showed 50% VOC Beta and 45% VOC Alpha between February-March 2021

Section 2: excluded studies	
Author	Reason for exclusion
<a href="#">Hollinghurst</a>	serious risk of bias
<a href="#">Moustsen-Helms</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Guijarro</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Thompson</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Salmeron Rios</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Raches Ella</a>	Phase 1 trial
<a href="#">Geisen</a>	clinical outcomes not reported
<a href="#">Shimabukuro</a>	clinical outcomes not reported
<a href="#">Li</a>	Phase 1 trial
<a href="#">Jacobson</a>	serious risk of bias
<a href="#">Mor</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Rudolph</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Britton</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Gray</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Regev-Yochay</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Cabezas</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Monge</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Vahidy</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Bjork</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Swift</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Corchado-Garcia</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Domi</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Rana</a>	no appropriate comparison group
<a href="#">Pilishville</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Kaabi</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Frenck</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Khawaja</a>	serious risk of bias
<a href="#">Palacios</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Khan</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Thompson</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Haas</a>	modelling study used to estimate cases averted
<a href="#">Voysey</a>	prevalence of variants unknown and suspected to be <50%
<a href="#">Gils</a>	clinical outcomes not reported

## Appendix 2: Glossary

**Alpha:** variant of concern B.1.1.7

**Beta:** variant of concern B.1.351

**Delta:** variant of concern B.1.617.2

**Gamma:** variant of concern P.1

**Epsilon:** variant of concern B.1.427/B.1.429

**HCW:** Healthcare workers

**LTC:** Long-term care (same as LTCF)

**Obs:** observational study

**Vaccine effectiveness (VE):** measure of how well a vaccine protects people from becoming infected (For example: VE of 92% means that 92% of people be well protected from becoming infected with COVID and 8% of people will still be at risk of becoming infected with COVID)

Appendix 3: Data-extraction template (under revision)

Vaccine product	BNT = BNT162b2 (Pfizer-BioNTech)
	MOD = mRNA-1273 (Moderna)
	AZ = ChAdOx1-S (AstraZeneca, COVISHIELD)
	JJ = Ad26.COV2 (Janssen [Johnson & Johnson])
Source	First author of study
Link	DOI or Pubmed ID
Date published	in format YYYY/MM/DD or preprint
Country	
Funding	public or industry
<b>Study details</b>	
Study type	RCT/cohort/data-linkage/test-negative/case-control/other
Surveillance	routine screening Y or N
Population(s)	gen public/LTC/Households/HCW/Other
Control group	not vaccinated, <7day vacc internal control, none, other
Total (N)	number of all study participants
% female	percent female or NA
LTC	number or NA
HCW	number or NA
Households	number or NA
>80	number older than this age group or unclear or NA
>70	number older than this age group or unclear or NA
>60	number older than this age group or unclear or NA
Notes	about study as a whole
<b>Outcomes</b>	outcomes separated by variant type
Group	group the outcomes in the next few columns applies to: all or subgroup label
Outcomes	confirmed infection/asymptomatic/mild symptomatic/severe symptoms/hosp/ICU/death/biomarkers
1st Dose VE	VE with 95% CI
Days post 1st dose	days post 1st dose when VE measured
2nd Dose VE	VE with 95% CI
Days post 2nd dose	days post 2nd dose when VE measured
Over Study Period	number
Rate per 100 pt years	vaccinated vs control
HR	vaccinated vs control
RR	vaccinated vs control

Biomarkers	antibody titres
PCR-conf	percent PCR confirmed with Ct value if available
NAAT	percent confirmed by NAAT
(repeat above outcome columns for each VARIANT)	
<b>Transmission</b>	infection rates in contacts (overlaps with studies of duration of infectivity)
Viral load	
Detection Frame	
Duration of infectivity	correlation of serial rRT-PCR test results with virus cultures, studies of contracts, modelling studies
<b>Critical appraisal</b>	See appendix 2
<b>Comments</b>	

## Appendix 4: Critical appraisal process

We appraise the quality of the individual studies using ROBINS-I. This tool classifies the Risk of Bias of a study as **Low, Moderate, Serious, Critical, or No Information**. Low Risk of Bias indicates High Quality, and Critical Risk of Bias indicates Very Low (insufficient) Quality. ROBINS-I appraises 7 bias domains and judges each study against an ideal reference randomized controlled trial. It also includes identifying all the confounders and co-interventions potentially relevant to the specific field of investigation (listed below). The table below indicates which domains we consider relevant to the VE&VOC field. We focus our assessment on the most relevant domains, but we consider potential bias arising in any of them.

ROBINS- I Domains	Anticipated relevance of the domain to VE & VOC
Bias due to	
Confounding	high relevance
Selection of participants into the study	intermediate relevance
Classification of interventions	low relevance
Deviations from intended intervention	low relevance
Missing data	high relevance
Measurement of outcomes	high relevance
Selection of the reported result	low relevance

### Overarching review question:

Participants	People at risk of COVID 19 (usually without but sometimes with previous, previous COVID19 infection)
Intervention	COVID19 Vaccine
Comparator	Unvaccinated people (*)
Outcomes	PCR-diagnosis of COVID 19 infection (**); symptomatic disease; hospital/ICU admission; death

(\*) confirmation of specific variant, or evidence the variant was the dominant circulating strain

(\*\*) before-after studies, where the infection rate in the first 2 weeks after the vaccination are used as control are commonly performed and maybe appraised but are open to confounding and bias.

**Aim for this study is to assess the effect of assignment to intervention (most vaccine studies will assess patients who received the vaccine)**

### List the potential confounding domains relevant to all or most studies

Socio-economic status, age, sex, gender, ethnicity, job role, LTC status, HCW status

### List co-interventions that could be different between intervention groups and that could impact on outcomes

Use of PPE; self-isolation

## **Appendix 5: Detailed description of the narrative summary statement**

We aim at providing a lay language, concise, standardized summary statement for each combination of vaccine/VOC for which we found evidence. Where more than one study was found, we will provide a summary statement.

We are reporting on the following clinical outcomes: prevention of infection, severe illness, and death, and prevention of transmission.

## **Appendix 6: Process for assigning Variant of Concern to studies**

A Variant of Concern is considered to be the dominant ( $\geq 50\%$ ) strain in a study if any of the following conditions apply:

- i) the authors make a statement about prevalence of VOC during the study time frame
- ii) time and setting of the study is consistent with a VOC being dominant according to the following open tracking sources:

Nextstrain. Real-time tracking of pathogen evolution. <https://nextstrain.org/>
