COVID-19 Living Evidence Synthesis # 8

(Version 8.22: 29 Mar 2023)

Question

What is the effectiveness of available COVID-19 vaccines for children and adolescents, including variants of concern?

Findings

For vaccine effectiveness in variants of concern (VOC), we present a <u>visual summary</u> of evidence in Table 1 and Table 2.

Methods are presented in Box 1 and in the following appendices:

- 1) <u>reference list</u>
- 2) glossary
- 3) <u>data-extraction template</u>
- 4) process for assigning variant of concern to studies
- 5) <u>research question and critical appraisal</u> <u>process</u>
- 6) detailed description of the narrative summary statement.

Overall, 108 studies were appraised and 43 used to complete this summary. The <u>reasons</u> for excluding the remaining 65 studies are reported in the second section of Appendix 2.

Two new studies had been added since the previous edition of this living evidence synthesis, which is signaled by a last updated date of 29 Mar 2023 (highlighted in yellow). The studies included results for VOC Omicron (2) – one reporting results by sublineage BA.1.

Studies examining effectiveness of vaccines in adults, including those covering periods beyond 120 days, are captured in COVID-END living evidence synthesis 6 and 10. The most recent version of all three syntheses (6,8,10) can always be found on the <u>COVID-</u> <u>END website</u>.

Box 1: Our approach

We retrieved candidate studies and updates to living evidence syntheses on vaccine effectiveness using the following mechanisms: 1) PubMed via COVID-19+ Evidence Alerts; 2) systematic scanning of pre-print servers; 3) updates to the COVID-END inventory of best evidence syntheses; and 4) crosscheck with updates from the VESPa team. We included studies and updates to living evidence syntheses identified up to two days before the version release date. We did not include press releases unless a preprint was available. A full list of included and excluded studies is provided in **Appendix 1**. A glossary is provided in **Appendix 2**.

Prioritized outcome measures: Infection, severe disease (as defined by the study investigators), death, and transmission.

Data extraction: We prioritized variant-confirmed and vaccinespecific data over total study population data (variant assumed and/or vaccine unspecified). We extracted data from each study in duplicate using the template provided in **Appendix 3**. Relevance to VOC is determined directly, when reported by study authors, or indirectly where reasonable assumptions can be made about the variant prevalent in the jurisdiction at the time of the study as described in **Appendix 4**.

Critical appraisal: We assessed risk of bias, direction of effect, and certainty of evidence. **Risk of bias:** assessed in duplicate for individual studies using an adapted version of ROBINS-I. **Direction of vaccine effect:** "prevented" or "protects" was applied to mean estimates or range of mean estimates of effect that are greater than or equal to 70% (the lowest acceptable limit for vaccine effectiveness as determined by WHO). **Certainty of evidence:** assessed for the collection of studies for each vaccine according to variant of concern using a modified version of GRADE. Details of the research question for this synopsis and the critical appraisal process are provided in **Appendix 5**.

Summaries: We summarized the evidence by presenting narrative evidence profiles across studies, with or without pooling, as appropriate. A template for the summary statements used on page 1 under "Findings" and in Table 1 under each VOC is provided in **Appendix 6**.

We update this document Wednesday every four weeks and post it on the COVID-END website.

Highlights of changes this report

- New data on Pfizer [BNT162b2] against VOC Omicron BA.1, have been added, with the data drawn from one study with moderate risk of bias (ref 43).
- New data on Pfizer [BNT162b2] and Sinovac [CoronaVac] against VOC Omicron, have been added, with the data drawn from one study with serious risk of bias (ref 44).

Pfizer/Comirnaty [BNT162b2]

<u>VOC Omicron</u>

- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (53.7% [95% CI, 43.3 to 62.2]-1 Obs [10]) in adolescents age 12 to 17 years
- We have moderate certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron** (range of mean estimates: 25 to 53% 3 Obs [5][23][37]) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from severe disease from VOC **Omicron** (56.3% [95% CI, 45.9 to 64.6] 1 Obs [23]) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (range of mean estimates: 14 to 27% 3 Obs [25][27][40]) in children age 5 to 11 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.1** (38% [95% CI, 33 to 43] 1 Obs [<u>40</u>]) in children age 5 to 11 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.2** (33.3% [95% CI, 3 to 53.3] 1 Obs [<u>29</u>]) in children age 3 to 11 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.2** (26.1% [95% CI, -0.3 to 45.6] 1 Obs [<u>29</u>]) in adolescents age 12 to 18 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.2** (32.4% [95% CI, -29 to 64.6] 1 Obs [<u>33</u>]) in persons age 5 to 17 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron** (range of mean estimates: 13 to 23% 2 Obs [23][25]) in children age 5 to 11 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (20.4% [95% CI, 2.5 to 35]-1 Obs [44]) in children and adolescents age 13 to 17 years
- We have low certainty evidence that <u>1 dose</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from severe disease from VOC **Omicron** (38.1% [95% CI, 20.9 to 51.5] 1 Obs [23]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (54.2% [95% CI, 45.8 to 61.2] 1 Obs [42]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (range of mean estimates: 26 to 70% -7 Obs [25][27][28][31][35][38][41]) in children age 5 to 11 years

- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron BA.1** (38% [95% CI,33 to 43] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.1** (range of mean estimates: 40 to <u>58%</u>] 2 Obs [<u>40</u>][<u>43</u>]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron BA.2/BA.2.12.1** (13% [95% CI, 4 to 20] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.2/BA.2.12.1** (4% [95% CI, -2 to 11] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron BA.4/BA.5** (7% [95% CI, -3 to 16] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron Omicron BA.4/BA.5** (10% [95% CI, 2 to 17] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (31.3% [95% CI, 27.8 to 34.7] 1 Obs [44]) in children and adolescents age 13 to 17 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from severe disease from VOC **Omicron** (range of mean estimates: 41 to 94% -2 Obs [<u>27][30]</u>) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron** (range of mean estimates: 48 to 71% -4 Obs [22][25][28][30]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (range of mean estimates: 25 to 83% 6 Obs [<u>11][13][26][31][35][36]</u>) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reached threshold for protection against severe disease from VOC **Omicron** (75.6% [95% CI, 58.1 to 85.8] 1 Obs [<u>23</u>]), in adolescents age 12 to 17 years
- We have moderate certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron** (range of mean estimates: 55 to 83% 5 Obs [5][22][23][26][37]) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** reached threshold for protection against MIS-C from VOC **Omicron** (92% [95% CI, 71 to 98] 1 Obs [7]), in adolescents age 12 to 18 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.2** (54.9% [95% CI, 38.9 to 66.8] 1 Obs [<u>29</u>]) in adolescents age 12 to 18 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron BA.1** (28.1% [95% CI, 25.2 to 30.8]-1 Obs [<u>39</u>]) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (range of mean estimates: 56 to 72% 3 Obs [26][35][36]) in adolescents age 12 to 17 years

- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from infection from VOC **Omicron** (70% [95% CI, 60 to 78] 1 Obs [<u>40</u>]) in children age 5 to 11 years
- We have moderate certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** did not reach threshold for protection from symptomatic infection from VOC **Omicron** (range of mean estimates: 62 to 87% 4 Obs [8][16][22][32]) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** reached threshold for protection against infection from VOC **Omicron BA.2** (86.8% [95% CI, 80.5 to 91.1] 1 Obs [29]) in adolescents age 12 to 18 years
- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** reached threshold for protection against symptomatic infection from VOC **Omicron BA.2/BA.2.12.1** (61% [95% CI, 27 to 79] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** reached threshold for protection against infection from VOC **Omicron BA.2/BA.2.12.1** (59% [95% CI, 34 to 75] 1 Obs [<u>40</u>]) in children age 5 to 11 years
- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** reached threshold for protection against symptomatic infection from VOC **Omicron BA.4/BA.5** (56% [95% CI, 47 to 63] 1 Obs [40]) in children age 5 to 11 years
- We have low certainty evidence that <u>3 doses</u> of **BNT162b2 (Pfizer)** reached threshold for protection against infection from VOC **Omicron BA.4/BA.5** (48% [95% CI, 39 to 55] 1 Obs [<u>40</u>]) in children age 5 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **BNT162b2 (Pfizer) followed by mRNA vaccine** did not reached threshold for protection against symptomatic infection from VOC **Omicron** (62.9% [95% CI, 60.5 to 65.1] 1 Obs [34]) in adolescents age 12 to 17 years

Moderna [mRNA-1723]

<u>VOC Omicron</u>

- We have low certainty evidence that <u>2 doses</u> of mRNA-1723 did not reach threshold for protection from infection from VOC Omicron (58% [95% CI, 47.5 to 66.5]-1 Obs [<u>42</u>]) in children age 0 to 4 years
- We have low certainty evidence that <u>2 doses</u> of mRNA-1723 did not reach threshold for protection from infection from VOC Omicron (range of mean estimates: 55 to 78% 1 Obs [35]) in adolescents age 12 to 17 years
- We have low certainty evidence that <u>2 doses</u> of mRNA-1723 did not reach threshold for protection from infection from VOC Omicron BA.1 (17.9% [95% CI, 14 to 21.5]-1 Obs [<u>39</u>]) in adolescents age 12 to 17 years

Sinovac [CoronaVac]

<u>VOC Omicron</u>

- We have low certainty evidence that <u>1 dose</u> of CoronaVac did not reach threshold for protection from symptomatic infection from VOC Omicron (21.2% [95% CI, 18.6 to 23.8] 1 Obs [21]) in children age 6 to 11 years
- We have low certainty evidence that <u>1 dose</u> of CoronaVac did not reach threshold for protection from infection from VOC Omicron BA.2 (-14.7% [95% CI, -54.7 to 14.6] 1 Obs [<u>29</u>]) in children age 3 to 11 years
- We have low certainty evidence that <u>1 dose</u> of **CoronaVac** did not reach threshold for protection from infection from VOC **Omicron BA.2** (21.5% [95% CI, -7.7 to 42.7] 1 Obs [<u>29]</u>) in adolescents age 12 to 18 years

- We have low certainty evidence that <u>1 dose</u> of CoronaVac did not reach threshold for protection from infection from VOC Omicron BA.2 (22.7% [95% CI, -38.3 to 56.8] 1 Obs [<u>33</u>]) in persons age 5 to 17 years
- We have low certainty evidence that <u>1 dose</u> of CoronaVac did not reach threshold for protection from ICU admission from VOC Omicron BA.2 (41.9% [95% CI, -10.4 to 72.2] 1 Obs [21]) in children age 6 to 11 years
- We have low certainty evidence that <u>1 dose</u> of **CoronaVac** did not reach threshold for protection from infection from VOC **Omicron** (20.7% [95% CI, 17.9 to 23.4] 1 Obs [44]) in children and adolescents age 13 to 17 years
- We have low certainty evidence that <u>2 doses</u> of **CoronaVac** did not reach threshold for protection from infection from VOC **Omicron** (17.5% [95% CI, 10.5 to 24]- 1 Obs [44]) in children and adolescents age 13 to 17 years
- We have low certainty evidence that <u>2 doses</u> of **CoronaVac** did not reach threshold for protection from symptomatic infection from VOC **Omicron** (39.8% [95% CI, 33.7 to 45.4] 1 Obs [21]) in children age 6 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **CoronaVac** did not reach threshold for protection from ICU admission from VOC **Omicron** (20.9% [95% CI, -177.2 to 85] 1 Obs [21]) in children age 6 to 11 years
- We have low certainty evidence that <u>2 doses</u> of CoronaVac did not reach threshold for protection from symptomatic infection from VOC Omicron BA.1 (38.2% [95% CI, 36.5 to 39.9] 1 Obs [12]) in children age 3 to 5 years
- We have low certainty evidence that <u>2 doses</u> of **CoronaVac** did not reach threshold for protection from ICU admission from VOC **Omicron BA.1** (69% [95% CI, 18.6 to 88.2] 1 Obs [<u>12</u>]) in children age 3 to 5 years
- We have low certainty evidence that <u>2 doses</u> of **CoronaVac** did not reach threshold for protection from infection from VOC **Omicron BA.2** (40.8% [95% CI, 12.8 to 59.5] 1 Obs [<u>29</u>]) in children age 3 to 11 years
- We have low certainty evidence that <u>2 doses</u> of **CoronaVac** did not reach threshold for protection from infection from VOC **Omicron BA.2** (55% [95% CI, 38.2 to 67.2] 1 Obs [<u>29</u>]) in adolescents age 12 to 18 years
- We have low certainty evidence that <u>3 doses</u> of **CoronaVac** reached threshold for protection against infection from VOC **Omicron BA.2** (92% [95% CI, 86.7 to 95.2] 1 Obs [29]) in adolescents age 12 to 18 years

Sinopharm [BBIBP-CorV]

<u>VOC Omicron</u>

- We have low certainty evidence that <u>2 doses</u> of Sinopharm (BBIBP-CorV) did not reach threshold for protection from infection from VOC Omicron BA.1 (37.6% [95% CI, 34.2 to 40.8]-1 Obs [<u>39</u>]) in children age 3 to 11 years
- We have low certainty evidence that <u>2 doses</u> of Sinopharm (BBIBP-CorV) did not reach threshold for protection from death from VOC Omicron BA.1 (66.9% [95% CI, 6.4 to 89.8]-1 Obs [<u>39</u>]) in children age 3 to 11 years

Table 1: Visual summary of evidence for COVID-19 vaccines for variants of concern (up to 28 days after 2 doses)

Percentages indicate <u>level of effectiveness</u> from 0% (no effect) to 100% (full protection): ranges of estimated means are provided when ≥ 1 study is available; estimated mean value is provided for single studies

Colour indicates level of certainty based on the evidence*

*Please note: prior to LES 8.9 moderate certainty evidence was coloured orange and low certainty evidence was coloured yellow

Table 2b: Visual summary of evidence for COVID-19 vaccines for variant of concern – Delta [2 doses > 28 days since last dose; 3 doses: > 1 days since last dose] (Revised 12 Oct 2022) (Last updated 12 October 2022 – will not be updated further)

Percentages indicate <u>level of effectiveness</u> from 0% (no effect) to 100% (full protection): ranges of estimated means are provided when ≥ 1 study is available; estimated mean value is provided for single studies

Colour indicates level of certainty based on the evidence*

*Please note: prior to LES 8.9 moderate certainty evidence was coloured orange and low certainty evidence was coloured yellow

| High certainty evidence | Moderate certainty evidence | Low certainty evidence |
|---------------------------------|--|------------------------------------|
| pooling of low to moderate | single RCT with low to moderate | single RCT or observational |
| risk of bias RCTs or pooling of | risk of bias or >one observational | study with serious risk of bias or |
| observational studies with low | study with low to moderate risk of | multiple low to serious risk of |
| risk of bias and consistent | bias and at least partially consistent | bias observational studies with |
| findings | findings | inconsistent findings |

| Outcome (and vaccine) | Variant | Number of doses | Time since Last Dose (days) | Age (years) | Vaccine Effectiveness |

|-----|---|--|---------------|--|--|--|--|--|--|
| Ref | Author | Bottom line | ROBINS- I* | Design, Notes | | | | | |
| | *Note: ROBINS-I score risk of bias: Low risk of bias indicates high quality | | | | | | | | |
| 1 | <u>Glatman-</u> <u>Freedman</u> | BNT162b2 showed VE 91.5% (95% CI, 88.2 to 93.9) against infection at least 8 days after <u>2nd dose</u> in adolescents age 12 to 15 years. There were no deaths in either group. | Serious | Population cohort in Israel of adolescents age 12 to 15 years; 2,034,591 vaccinated person- days and 13,623,714 unvaccinated person-days; time and setting for VOC Delta <i>Included in LES 8.1</i> | | | | | |
| 2 | <u>Reis</u> | BNT162b2 showed VE 59% (95% CI, 52 to 65) against infection 14 to 20 days after <u>1st dose</u> in adolescents age 12 to 18. BNT162b2 showed VE 90% (95% CI, 88 to 92) against infection 7 to 21 days after <u>2nd dose</u> in adolescents age 12 to 18. | Moderate | Case-control study in Israel; 94,354 vaccinated matched to 94,354 unvaccinated adolescents age 12 to 18; time and setting for VOC Delta <i>Included in LES 8.1</i> | | | | | |
| 3 | Tartof | BNT162b2 showed VE 67% (95% CI, 50 to 78) against infection and VE 100% (95% CI, 100 to 100) against hospitalization at least +14 days after <u>1st</u> dose in adolescents age 12 to 15 years. BNT162b2 showed VE 91% (95% CI, 88 to 93) against infection and VE 81% (95% CI, -55 to 98) against hospitalization at least +7 days after <u>2nd dose</u> in adolescents age 12 to 15 years. | Moderate | Retrospective Cohort in USA of 3,436,957 Kaiser Permanente Southern California (KPSC) healthcare system members \geq 12 years of age between Dec 14, 2020 – Aug 8, 2021. The cohort included 122,779 adolescents age 12 to 15 years. The primary exposure was being fully vaccinated, defined as receiving 2 doses of BNT162b2 with \geq 7 days after the second dose. Over the study period, 28.4% of 9,147 specimens sent for whole genome sequencing (WGS) and viral lineage designation were Delta. <i>Included in LES 8.1</i> | | | | | |
| 4 | <u>Olson</u> | BNT162b2 showed VE 94% (95% CI, 90 to 96) against hospitalization at least +14 days after 2nd dose in adolescents age 12 to 18 years. BNT162b2 showed VE 95% (95% CI, 88 to 97) in adolescents age 12 to 15 years and VE 94% (95% CI, 88 to 97) in adolescents age 16 to 18 years against hospitalization at least +14 days after 2nd dose. | Moderate | Test-negative study in U.S of adolescents age 12 to 18 years between Jun 1–Oct 25, 2021; 299 fully vaccinated (receipt of 2 doses of BNT162b2 vaccine, with the second dose administered ≥14 days before illness onset), 55 partially vaccinated (had received only one dose of vaccine or who had | | | | | |

| | | | | received a second does loss them |
|---|--------|--|----------|---|
| | | BNT162b2 showed VE 98% (95% CI, 93 to 99) against ICU admission at least +14 days after <u>2nd dose</u> in adolescents age 12 to 18 years. | | received a second dose less than 14 days before illness onset) and 868 unvaccinated (no receipt of any COVID-19 vaccine before illness onset), time and setting for VOC Delta. <i>Included in LES 8.2</i> <i>last update in LES 8.3</i> |
| 5 | Powell | BNT162b2 showed after 1^{st} dose VE 74.5% (95% CI, 73.2 to 75.6) at 14-20 days, VE 63.4% (95% CI, 61.7 to 65.1) at 28-34 days, VE 47.5% (95% CI, 44.9 to 49.9) at 56-69 days, and VE 53.1% (95% CI, 41.6 to 62.4) at least 84 days, in adolescents age 12 to 15 years against infection. (VOC Delta) BNT162b2 showed after 1^{st} dose VE 49.6% (95% CI, 43.9 to 54.8) at 14-20 days, VE 42.1% (95% CI, 36.7 to 46.9) at 28-34 days, VE 22.5% (95% CI, 19.1 to 25.8) at 56-69 days, and VE 17.2% (95% CI, 12.0 to 22.1) at least 84 days, in adolescents age 12 to 15 years against infection. (VOC Omicron) BNT162b2 showed after 1^{st} dose VE 75.9% (95% CI, 74.3 to 77.3) at 14-20 days, VE 60.6% (95% CI, 58.1 to 62.9) at 28-34 days, VE 36.3% (95% CI, 33.1 to 39.3) at 56-69 days, VE 29.3% (95% CI, 25.9 to 32.6) at 84-104 days, and VE 30.9% (95% CI, 25.4 to 36.0) at least 105 days, in adolescents age 16 to 17 years against infection. (VOC Delta) BNT162b2 showed after 1^{st} dose VE 51.4% (95% CI, 42.7 to 58.8) at 14-20 days, VE 33% (95% CI, 18.6 to 44.9) at 28-34 days, VE 26.6% (95% CI, 17.4 to 34.8) at 56-69 days, VE 20.5% (95% CI, 13.0 to 27.3) at 84-104 days, and VE 51.4% (95% CI, 42.7 to 58.8) at 14-20 days, in adolescents age 16 to 17 years against infection. (VOC Delta) BNT162b2 showed after 1^{st} dose VE 51.4% (95% CI, 42.7 to 58.8) at 14-20 days, VE 33% (95% CI, 18.6 to 44.9) at 28-34 days, VE 26.6% (95% CI, 17.4 to 34.8) at 56-69 days, VE 20.5% (95% CI, 13.0 to 27.3) at 84-104 days, and VE 12.5% (95% CI, 6.9 to 17.8) at least 105 days, in adolescents age 16 to 17 years against infection. (VOC Omicron) BNT162b2 showed after 2^{st} dose VE 93.2% (95% CI, 6.9 to 17.8) at least 105 days, in adolescents age 16 to 17 years against infection. (VOC Omicron) BNT162b2 showed after 2^{st} dose VE 93.2% (95% CI, 81.5 to 97.5) at 7-13 days and VE 87.2% (95% CI, 73.7 to 93.8) at least 14 days in adolescents age 12 to 15 years against infection. (VOC Delta) | Moderate | Test-negative case-control design in England of adolescents age 12-17 years from week 37, 2021 onwards; there were 617,259 eligible tests for 12-15-year-olds and 225,670 for 16-17-year-olds. Symptomatic 12-15-year-olds and 16-17-year-olds with PCR- confirmed SARS-COV-2 infection was compared with vaccination status in symptomatic adolescents in the same age-groups who had a negative SARS-COV-2 PCR test. All cases prior to week 48 were defined as Delta, unless S gene target failure (SGTF), genotyping or sequencing information confirmed otherwise. Tests were defined as Omicron from week 48 onwards using SGTF, genotyping or sequencing information. <i>Included in LES 8.6</i> <i>Link Updated in LES 8.8</i> |

Appendix 2: Glossary (revised 13 Jan 2022)

AZ: AstraZeneca

Alpha: variant of concern B.1.1.7

Beta: variant of concern B.1.351

Delta: variant of concern B.1.617.2

Gamma: variant of concern P.1

Epsilon: variant of concern B.1.427/B.1.429

MIS-C: Multisystem inflammatory syndrome in children

MOD: Moderna

Obs: observational study

OR: odds ratio

PF: Pfizer

RME: range of mean estimates across 2 or more studies

VE (Vaccine effectiveness): measure of how well a vaccine protects people from getting the outcome of interest in real-world practice (For example: VE of 92% against infection means that 92% of people will be protected from becoming infected with COVID and 8% of people will still be at risk of becoming infected with COVID and 8% of people will still be at risk of becoming infected with COVID and 8% of people will still be at risk of becoming infected with COVID.

VET: vaccine effectiveness against transmission

VOC: variant of concern

VOI: variant of interest

Appendix 3: Data-extraction template (revised 13 Jan 2022)

| Vaccine product | |

| Dose and timing | |
| Control group | not vaccinated, <7day vaccinated internal control, none, other |
| Total (N) | number of all study participants |
| Female | number or % |
| < 12 years | number or % |
| \geq 12 years | number or % |
| Outcomes | outcomes separated by VOC type |
| Outcomes | confirmed infection/asymptomatic/mild symptomatic/severe symptoms/hospitalized/ICU/death/MIS-C |
| 1st Dose VE | VE with 95% CI |
| Days post 1st dose | days post 1st dose when VE provided |
| 2nd Dose VE | VE with 95% CI |
| Days post 2nd dose | days post 2nd dose when VE provided |
| Rates per X person- days/years | vaccinated vs control |
| HR | vaccinated vs control |
| RR | vaccinated vs control |
| Adjusted | Regression, stratification, matching and associated variables |
| Transmission | infection rates in unvaccinated contacts of vaccinated individuals |
| Critical appraisal | See Appendix 5 |

Appendix 4: Process for assigning Variant of Concern to studies

A Variant of Concern is considered to be the dominant (\geq 50%) strain in a study if any of the following conditions apply:

i) the authors make a statement about prevalence of VOC during the study time frame

ii) time and setting of the study is consistent with a VOC being dominant according to the following open tracking sources:

Nextstrain. Real-time tracking of pathogen evolution. <u>https://nextstrain.org/</u> Outbreak Info. <u>https://outbreak.info/location-reports</u>

Appendix 5: Research question and critical appraisal process (revised 28 Mar 2023)

| neview question. | |
|------------------|--|
| Participants | People aged under 18 years at risk of COVID-19 (usually without but |
| | sometimes with previous COVID-19 infection) |
| Intervention | COVID-19 Vaccine |
| Comparator | Unvaccinated children and adolescents (*) |
| Outcomes | PCR-diagnosis of COVID-19 infection; symptomatic disease; hospital/ICU |
| | admission; death; transmission; MIS-C |

Review question:

(*) Eligible studies must have a comparison group (unvaccinated; non-immune period; time since vaccination; 2 doses vs 3 doses); before-after studies, where the infection rate in the first 2 weeks after the vaccination are used as control are commonly performed and may be appraised

Key exclusion criteria

Studies that address the question of interest but from which the information of children cannot be separated from that of adults.

Comparison of one vaccine vs another (e.g., relative effectiveness) is not eligible. Studies reporting only antibody responses are excluded.

Critical Appraisal Process

We appraise the quality of the individual studies using an adapted version of ROBINS-I. This tool classifies the Risk of Bias of a study as **Low, Moderate, Serious, Critical, or No Information**. <u>Low Risk of Bias indicates High Quality, and Critical Risk of Bias indicates Very Low (insufficient) Quality</u>. ROBINS-I appraises 7 bias domains and judges each study against an ideal reference randomized controlled trial. To improve the utility of ROBINS-I for assessing studies reporting vaccine effectiveness, we have focused on study characteristics that introduce bias as reported in the vaccine literature. (WHO. Evaluation of COVID-19 vaccine effectiveness. Interim Guidance. 17 March 2021). Studies rated as "critical" risk of bias will not be included in the Summary statements on Page 1-2 (exception: if limited data available for an outcome for a VOC). An overall judgement of "serious" or "critical" is given when the study is judged to be at serious or critical risk of bias in at least one domain or "serious" in 3 separate ROBINS-I domains.

| VE Study | Description |
|---------------------------|--|
| Characteristics that | |
| may introduce bias | |
| Study design | In cohort studies, people who get vaccinated may differ in health-seeking |
| | behaviour from people who do not get vaccinated; using a test-negative study |
| ROBINS-I: Bias in | design minimizes this type of bias |
| selection of participants | |
| into study | Examples and typical judgement: |
| | • test-negative design with a clearly defined symptomatic study population |
| | (low) |
| | • test-negative design (mixed or unclear study population) or case-control |
| | or cohort design or data-linkage with no concerns (moderate) |
| | • cross-sectional design or case-control (concerns about whether controls |
| | had same access to vaccines/risk of exposure to COVID or unclear) or |
| | cohort design (concerns that exposed and non-exposed were not drawn |
| | from the same population) (serious) |

| Method for confirming | Questionnaires are prone to recollection bias; Population databases |
|--------------------------|---|
| vaccination | developed for purpose of tracking COVID vaccines minimize this type of |
| | bias |
| ROBINS-I: Bias in | |
| classification of | Examples and typical judgement: |
| interventions | • database linkage study (low) |
| | • Questionnaire with confirmation by an additional method (e.g., registry) |
| | of at least a subset of study population (moderate) |
| | • Questionnaire without confirmation by an additional method (serious) |
| | • Estimating vaccination status based on surveillance data alone (critical) |
| Databases used for | Databases developed for collecting data on COVID are less prone to bias |
| retrieval of COVID test | due to missing information and misclassification |
| results, participant | |
| prognostic factors, and | Examples and typical judgement: |
| clinical outcomes | database for non-COVID purpose but with individual level data |
| | (moderate) |
| ROBINS-I: Bias in | • database for non-COVID purpose without individual level data (serious) |
| classification of | • no or unclear description of database type (critical) |
| interventions | |
| Assignment of | Using date of symptom onset (if within 10 days of testing) as infection start |
| infection start date | date reduces risk of misclassification bias (e.g., vaccinated participant who is |
| | reported as COVID+ may have been infected prior to receiving the vaccine |
| ROBINS-I: Bias in | or during non-immune period) and sensitivity of assays decreases over time |
| classification of | |
| interventions | Examples and typical judgement: |
| | • using a PCR positive test that was part of an ongoing standardized |
| | monitoring system (e.g., within a health network) (low) |
| | • using sample date without interview or documented confirmation of |
| | symptoms ≤ 10 days (relevant for symptomatic disease only) (serious) |
| Verification of | Prospective, standardized collection of symptoms from patients reduces risk |
| symptoms | of missing information bias; testing within 10 days after symptom onset |
| | reduces risk of false-negative COVID test |
| ROBINS-I: Bias in | |
| classification of | Examples and typical judgement: |
| interventions | • using sample date without patient report/ documented confirmation of |
| | symptoms ≤ 10 days (relevant for symptomatic disease only) (serious) |
| | • if symptomatic COVID is not an outcome (no information) |
| Accounting for non- | Reported absence of vaccine effect during non-immune period reduces risk |
| immune period (first 14 | of residual confounding bias |
| days after first vaccine | |
| dose) | Example/common case: |
| | • presence of an effect during non-immune period or result not reported |
| ROBINS-I: Bias due to | (moderate) |
| confounding | • unclear that non-immune period was considered (serious) |
| Inclusion of | Exclusion (or separate analysis) of participants with prior COVID infection |
| participants with prior | reduces concern about differences in infectivity as well as risk-taking and |
| COVID infection | health-seeking behaviour |
| ROBINS-I: Bias due to | Examples and typical judgement: |
| confounding | inclusion of prior infection status as a covariate in the models (moderate) |
| comounding | previously infected not excluded or analyzed separately (serious) |
| | • previously infected not excluded of analyzed separately (serious) |

| Accounting for | Accounting for calendar time reduces bias due to differences in vaccine |
|--|---|
| calendar time | accessibility and risk of exposure over time |
| ROBINS-I: Bias due to | Examples and typical judgement: |
| confounding (time- varying confounding) | • use of time-varying statistics without explicit mention of adjustment for calendar time (moderate) |
| | not taken into account but short-time frame (e.g., ≤2 months) (serious) not taken into account and time frame >2 months (critical) |
| Adjustment for prognostic factors | Adjustment for prognostic factors for COVID infection, severity of disease, and vaccination, such as age, gender, race, ethnicity, socioeconomic factors, occupation (HCW, LTC), and chronic medical conditions |
| ROBINS-I: Bias due to | |
| confounding | Examples and typical judgement: |
| | • no or insufficient adjustment for occupation (or number of tests as a surrogate for exposure risk) -exception age>65 or LTCF resident (moderate) |
| | • no or insufficient adjustment for socioeconomic factors (or neighborhood or income as a surrogate), race, ethnicity (serious) |
| | no or insufficient adjustment for age (any study population) or chronic medical conditions (LTC)(critical) |
| Testing frequency | Similar frequency of testing between groups reduces risk of bias introduced by detecting asymptomatic infection in one group but not in another (e.g., |
| ROBINS-I: Bias in | when only one group undergoes surveillance screening) |
| measurement of | Examples and traical independent: |
| outcomes | <u>Examples and typical judgement</u>: no systematic screening but consistent methods for detection in one |
| | group vs. the other, e.g., within health networks (moderate) screening performed for a subset of both study groups (serious) |
| | screening performed routinely in one study group but not in the other (critical) |

Appendix 6: Detailed description of the narrative summary statement (revised 20 Jun 2022)

We include studies with the following clinical outcomes: prevention of infection, MIS-C, severe disease (as defined by the study investigators), hospitalization, death, and prevention of transmission. These outcomes were selected because they are less susceptible to bias, or they are important for parents and patients. If data are not available for these specific outcomes, but are available for symptomatic infection, data for these additional outcomes are provided temporarily.

We aim at providing a lay language, standardized summary statement for each combination of vaccine and VOC for which we found evidence.

Where <u>more than one study</u> was found, we will provide a summary statement with a <u>range of the</u> <u>estimates across the studies</u>.

Where a <u>single study</u> provided data, we will provide the <u>estimate plus 95% confidence interval</u> for that study. As additional studies are added, the estimate plus confidence interval will be replaced by a range as described above.

In the summaries, "prevented" or "protects" will be applied to mean estimates that are greater than or equal to 70% with the lower 95% CI \geq 50%, or range of mean estimates that are greater than or equal to 70% for <u>infection</u> and, mean estimates that are greater than or equal 90% with lower limit of 95% CI \geq 70%, or range of mean estimates that are greater than or equal to 90% for <u>severe disease</u> (the lowest acceptable limit for vaccine effectiveness as determined by WHO); otherwise "did not reach threshold for protection" will be applied.
