Rapid Synthesis:
Changing Practice to Achieve Equity in Ontario’s Education Sector
30-day response

3 October 2017
Forum+

Forum+ builds on McMaster University’s expertise in advancing human and societal health and well-being in our efforts to strengthen social systems and get the right programs, services and products to the people who need them. By social systems we mean the following government sectors and program areas: citizenship, children and youth services, community and social services, consumer protection, culture and gender, economic development and growth, education, employment, food safety and security, government services, housing, infrastructure, public safety and justice, recreation, and transportation. Said another way, our work through Forum+ addresses most of the Sustainability Development Goals, with the exceptions of the health part of goal 3 (which the Forum already covers well), most of goal 7 (energy), and all of goals 13-15 (climate, water and land).

Timeline

Rapid syntheses can be requested in a three-, 10- or 30-business-day timeframe. This synthesis was prepared over a 30-business-day timeframe. An overview of what can be provided and what cannot be provided in each of the different timelines is provided on the Forum+’s Rapid Response program webpage (www.mcmasterforum.org/find-evidence/rapid-response).

Funding

The rapid-response program through which this synthesis was prepared is funded by the Education Research & Evaluation Strategy Branch (ERESB) of the Ontario Ministry of Education. The McMaster Health Forum receives both financial and in-kind support from McMaster University, including funds from the Provost’s Strategic Alignment Fund to support the development of Social Systems Evidence, which we drew on heavily in preparing the rapid synthesis. The views expressed in the rapid synthesis are the views of the authors and should not be taken to represent the views of the Ontario Ministry of Education or McMaster University.

Conflict of interest

The authors declare that they have no professional or commercial interests relevant to the rapid synthesis. The funder played no role in the identification, selection, assessment, synthesis or presentation of the research evidence profiled in the rapid synthesis.

Merit review

The rapid synthesis was reviewed by a small number of policymakers, stakeholders and researchers in order to ensure its scientific rigour and system relevance.

Acknowledgments

The authors wish to thank Rex Park, Fanny Cheng, Avery Qurashi and Kelly Dong for assistance with identifying, reviewing and synthesizing literature. We are especially grateful to Erica Okezie-Phillips and Sandra Wilson for their insightful comments and suggestions. The views expressed in the rapid synthesis should not be taken to represent the views of these individuals.

KEY MESSAGES

**Question**
- What is known about options for addressing inequities in achievement and well-being outcomes among marginalized and racialized students?

**Why the issue is important**
- Ontario is home to people from more than 200 countries who speak more than 130 languages, and multiculturalism, human rights and diversity are core values embraced in the province.
- However, there continue to be well-documented inequities in achievement and well-being outcomes among select groups of students in Ontario (e.g., ethnic minorities, recent immigrants or refugees, Indigenous students, LGBTQ).
- Given the rapidly changing and increasingly complex society in Ontario, it is timely to take stock of what is known about the effectiveness of options for addressing inequities in achievement and well-being outcomes among marginalized and racialized students.

**What we found**
- We identified a total of 23 recent documents that addressed the question, including one overview of systematic reviews, nine systematic reviews, four non-systematic reviews including one comparing education policies in Organisation for Economic Development and Cooperation jurisdictions, and nine primary studies of interventions conducted in Canada.
- The literature showed a great diversity at the levels in which interventions were implemented including:
  1) student- or teacher-level interventions;
  2) school- and community-level interventions;
  3) district-level interventions; and
  4) broader system-level interventions.
- At the student or teacher level, we found evidence that supported the provision of leadership opportunities for students who were recent immigrants, and for the use of experiential learning and reflective tasks for teachers.
- At the school and community level, we found:
  - evidence that supported the provision of out-of-school academic programs, mentorship programs, case management, college-oriented programming, vocational training, physical health services, mental health counselling, culturally adaptive programming, alternative education, and classroom restructuring for students; and
  - evidence that supported improving the availability of school-level resources, providing collaborative mentorships for teachers, and hiring culturally responsive staff members to enable them to address the diverse needs of their schools.
- At the district level, we found supportive evidence for increasing the number of students, including students from lower socio-economic statuses, who attend grammar schools (i.e., schools requiring high scores on a standardized entrance exam taken at age 11).
- At the system level, we found:
  - evidence to support the use of large-scale assessments to develop education policy, strategies to promote fairness and equity in assessment processes, increasing school expenditures, individual financial incentives, and early childhood education;
  - mixed findings for the use of block grants or school choice; and
  - evidence that repeating a grade and early streaming hinder gains in the equity.
- Most of the literature included in this synthesis focused on examining the effectiveness of interventions to improve achievement and well-being among marginalized and racialized students, but did not explore explicitly whether these interventions were effective in reducing inequities between the majority of students and marginalized or racialized students.
QUESTION

• What is known about options for addressing inequities in achievement and well-being outcomes among marginalized and racialized students?

WHY THE ISSUE IS IMPORTANT

Ontario is home to people from more than 200 countries who speak more than 130 languages. Multiculturalism, human rights and diversity are core values embraced in the province. (1) The public education system can play a crucial role in supporting these core values by transcending socio-economic and ethno-cultural barriers, and helping students to become engaged, productive and responsible citizens.

Yet, there are well-documented inequities in achievement outcomes among students in Ontario. This includes, among others, racial or ethnic minorities, recent immigrants, children from low-income families, Francophone students, Indigenous students and students with special education needs. (1) For example, in 2012, the Toronto District School Board found that black students with Caribbean and Canadian-born parents under-performed on the Education Quality and Accountability Office (EQAO) test in all areas, particularly in mathematics, compared to the average student in the same district. (2) In addition, the same census found that less than half of Indigenous students were successful on the Ontario Secondary School Literacy Test taken in grade nine. (2) There are also regional differences in the province with, for instance, lower levels of education attainment in Northern Ontario than the provincial average. (3)

Inequities in well-being outcomes are also observed. It is estimated that as many as one in five children and youth in Ontario will experience some form of mental health problem, which may in turn create barriers in educational achievement. (4) However, some groups are more affected than others. For instance, First Nations youth die by suicide about five to six times more often than non-Indigenous youth. (5) Lesbian, gay, bisexual, transgender and queer (LGBTQ) youth face approximately 14 times the risk of suicide and substance abuse than heterosexual peers. (6) Youth living in the lowest-income neighbourhoods had the highest rates of suicide, emergency department visits for deliberate self-harm, acute care mental health service use, and prevalence of treated schizophrenia. (4)

Inequities in achievement and well-being may be caused (or exacerbated) by individual and structural factors, including systemic biases and barriers embedded at various levels of the education system (for example, in the student or teacher, school, district, or government levels) as well as in government policies, education structures and processes, organizational cultures, and educators’ capacity, among others. Thus, there have been calls for interventions to address structural inequities in education, to help reduce the gap in educational achievement and well-being for marginalized and racialized students. (7)
In response to some of these challenges, the Government of Ontario first launched its Equity and Inclusive Education Strategy in 2009.(7) In 2014, the strategy was renewed with the goals of understanding, identifying, addressing and eliminating the barriers (for example, sex, sexual orientation, gender identity, gender expression, race, ethnicity, religion, socio-economic status, or physical and mental abilities) to learning, growing, and fully contributing to society.(8)

Given the rapidly changing and increasingly complex society in Ontario, it is timely to take stock of what is known about the effectiveness of options for addressing inequities in achievement and well-being outcomes among marginalized and racialized students, as well as conduct a jurisdictional scan (and targeted search) of equity-improving policies in OECD countries.

In conducting this rapid synthesis, we prioritized synthesized and pre-appraised research evidence from systematic reviews of effects, systematic reviews addressing other questions than effectiveness, and economic evaluations of interventions that were published since 2010. Findings from these documents were supplemented by a targeted search for primary studies of interventions in Canadian provinces and territories that were published since 2013.

To guide this rapid synthesis, three key concepts should be defined:

- Diversity refers to “the presence of a wide range of human qualities and attributes within a group, organization, or society. The dimensions of diversity include, but are not limited to, ancestry, culture, ethnicity, gender, gender identity, language, physical and intellectual ability, race, religion, sex, sexual orientation, and socio-economic status.”(7)
- Equity refers to “a condition or state of fair, inclusive, and respectful treatment of all people. Equity does not mean treating people the same without regard for individual differences.”(7)
- Inclusive education refers to “education that is based on the principles of acceptance and inclusion of all students. Students see themselves reflected in their curriculum, their physical surroundings, and the broader environment, in which diversity is honoured and all individuals are respected.”(7)
We identified a total of 23 recent documents addressing the question, including one overview of systematic reviews, nine systematic reviews, four non-systematic reviews including one comparing education policies in Organisation for Economic Development and Cooperation jurisdictions, and nine primary studies of interventions conducted in Canada.

We present the findings from systematic reviews along with an appraisal of whether their methodological quality (using the AMSTAR tool) is high (scores of 8 or higher out of a possible 11), medium (scores of 4-7) or low (scores less than 4) throughout the document.

We provide more details about each systematic review and the quality-appraisal process in Appendix 1, and for the included primary studies in Appendix 2. In addition, we have included in the bibliography other older systematic reviews of effects that were identified during our search, but due to the mentioned time constraints could not be included in the rapid synthesis (see Appendix 3), (9-22) along with a list of systematic reviews of effects that have registered titles and are being planned (see Appendix 4), (23-29)

**Question: What is known about options for addressing inequities in achievement and well-being outcomes among marginalized and racialized students?**

The reviews and primary studies present evidence on a number of interventions that seek to address inequities in achievement and well-being among marginalized and racialized students. While many of these programs were found to be effective at improving retention of students and academic achievements, many of the reviews noted that the interventions alone are rarely enough to close the achievement gap for disadvantaged students.

The systematic reviews and primary studies largely focus on the use of school and community-based programs as well as broader system (or government) level policies to improve academic achievement, with relatively less pre-appraised and synthesized evidence having been published on interventions at either the student or teacher level or at the district level.

Most of the pre-appraised evidence found in these systematic reviews originates from the United States, with very few studies included in the reviews conducted in Canada. In response, a targeted search was conducted of recent primary studies conducted in Canada (and largely in Ontario). Despite these efforts, questions should be raised regarding the applicability and transferability of evidence, particularly if the contexts of the literature may not be aligned with specificities or core values of the education system in Ontario.
Lastly, it is important to note that the included systematic reviews focused on examining the effectiveness of interventions to improve achievement and well-being among marginalized and racialized students. For example, the systematic reviews could tell us whether some interventions produce larger achievement gains than usual practice among marginalized and racialized students, but not whether they are effective in reducing the achievement gap with the majority of students.

We summarize the key findings from these documents below according to the level of interventions: 1) student- or teacher-level interventions; 2) school- and community-level interventions; 3) district-level interventions; and 4) broader system-level interventions.

**Student- or teacher-level interventions**

We found one systematic review and one primary study that addressed two interventions at the student or teacher level.

At the student level, one primary study found that providing secondary school students who are recent immigrants with leadership opportunities improved their confidence in engaging with their Canadian-born peers.(30)

At the teacher level, one medium-quality systematic review found that experiential learning combined with reflective tasks was an effective intervention to improve student-teacher understanding and application of social justice in diverse classrooms.(31)

**School- or community-level interventions**

We found six systematic reviews, two non-systematic reviews and six primary studies that addressed school- or community-level interventions. Mixed evidence was found for a number of these interventions, with the variability of the intervention design frequently being cited in the literature as limiting the ability to determine levels of effectiveness or to compare the effectiveness across interventions.(32-36) Interventions examined by the literature have been grouped into six categories: 1) out-of-school-time academic and mentoring programs; 2) college-oriented and vocational training programs; 3) physical and mental health services; 4) culturally responsive and adaptive education programs; 5) training and support programs targeting school staff; and 6) interventions targeting hiring practices and procedures.

**Out-of-school-time academic and mentoring programs**

We found three systematic reviews that addressed out-of-school-time academic programs and mentoring programs. One recent medium-quality review focusing on out-of-school-time academic programs for low socio-economic, black, at-risk elementary students found that programs were most effective when provided for a specific subject and during the summer hours.(37) However, the specificity of the population under review may limit the transferability of these findings.(37)

The same recent medium-quality review found that mentoring programs that focused on academics encouraged respect and personal growth among disadvantaged students.(37) Similarly, one older low-quality review and one older medium-quality review found that mentorship programs and case-management programs (i.e., programs that connect students and their families to needed social and community resources) were a promising strategy to improve pupil behaviour and academic performance, as well as to reduce dropout rates.(33; 35)

**College-oriented and vocational training programs**
We found two medium-quality systematic reviews, one older and one recent, that assessed the effectiveness of college-oriented and vocational training programs. The reviews found that both college-oriented programming and vocational training significantly reduced dropout rates of students from secondary school, and improved graduation rates from high schools as well as the percentage of college enrolments. (34; 35)

**Physical and mental health services**

We found one medium-quality review addressing the provision of physical health services at school, as well as one older medium-quality systematic review and one non-systematic literature review focusing on the effects of providing mental health and counselling services (including social and emotional skills training) to students.

A medium-quality review examined the effects of school-based health clinics and found that they were associated with substantial educational benefits, including reductions in the rates of suspension and non-completion, as well as increases in grades and grade promotion. (38) In addition, the broader community saw a number of benefits including reductions in emergency department visits and hospital utilization for all conditions, as well as an increase in contraception use and access to prenatal care. (38)

One non-systematic literature review examined the use of mental health interventions to improve the social and emotional functioning of students who are refugees or asylum seekers and may have experienced trauma. (39) The non-systematic review found that leveraging psychologists, counsellors, social workers and other education specialists to deliver cognitive behavioural therapy was effective in increasing the accessibility of these interventions. (39) It also found that the delivery of either creative expression interventions or multi-modal interventions had mixed results and would likely be difficult to implement at the school-level due to their reliance on specialists and outside agencies. (39) Similarly, one older medium-quality review found that providing students with counselling services significantly reduced dropout rates. (35)

**Culturally responsive and adaptive education programs**

A common finding to emerge with regards to the needs of historically marginalized groups is the importance of providing adaptive programming, whether this includes integrating cultural aspects into teaching or adapting the pedagogical style to better match rates at which students are learning. We found four primary studies examining the use of (or need for) culturally responsive programing, and three medium-quality reviews that focused on alternative education and class restructuring.

One primary study found that culturally relevant programs for Indigenous youth in Ontario (through Peer Assisted Learning Strategies) was perceived as contributing to student success, improved relationships, increased sense of belonging, and improved confidence and leadership skills of participants. (40) A second primary study conducted in Ontario revealed that students from marginalized backgrounds are more engaged when taught in a curricula that connects to their lived experiences or cultural background. (41) Another primary study found that there was a need for more critical analysis of national and global diversity and inequality in school curriculums, particularly when teaching students about civics and citizenship. (42)

A fourth primary study found the use of socio-culturally responsive media studies improved students’ overall attendance, fostered a sense of community, created space for students’ voices, enacted multiple literacies, and helped students to become politically engaged citizens within the larger school community. (43)

In terms of alternative education and classroom restructuring, two medium-quality reviews found that both alternative education and classroom restructuring reduced dropout rates and significantly improved graduation rates among secondary school students, with slightly greater improvements noted for classroom restructuring (e.g., longer classes, smaller class sizes, or creating small learning groups). (34; 35) One of the medium-quality reviews reported that reducing student-teacher ratios may establish higher academic standards and better engage students in learning-related decisions. (34)
Finally, one medium-quality systematic review focused on marginalized students’ perspectives on alternative education. The review found that students attending alternative schools described them as physical, psychological and emotionally safe spaces, where they felt comfortable acknowledging their lack of knowledge. The review further found that these characteristics were often critical in a student’s decision to stay in school.(44)

**Training and support programs targeting school staff**

We found two primary studies and one non-systematic literature review that focused on supports (or identifying the need for supports) for school staff (including principal, vice-principal, teachers and counsellors) to enable them to address the diverse needs of their schools.

One primary study found that after reviewing publicly available documents and interviewing educational leaders from Ontario and the United States, there is a clear need for increased school-level resources (e.g., training opportunities to learn cultural competencies, support from colleagues, development of equity strategies) to prepare school principals, vice-principals and other school leaders to address the increasingly diverse needs of their students.(45)

Another primary study from Ontario focused on the use of collaborative mentorships between teachers to improve teacher-student relationships at a large multi-ethnic, multi-racial suburban school.(46) The case study found the following success factors for collaborative mentorship:

- commitment of the mentor and mentees to a path of equity and diversity;
- trust and respect between mentor and mentee;
- development of a commitment of support where multiple voices were brought to bear on tensions that arose;
- understanding that acquiring skills and attitudes to teach effectively in diverse classrooms is challenging and that each person is at a different stage of understanding;
- handling resistance through dialogue that does not cause personal or professional harm; and
- a recognition of the emotional investment that this kind of work requires.(46)

One non-systematic literature review examined challenges that influence the ability of high-school counsellors to improve post-secondary outcomes of college preparation and enrolment for students, including: role confusion of counsellors due to the many diverse responsibilities they hold; student-counsellor ratio and the available time for college counselling; inadequate college resources (e.g., brochures or knowledge of different programs); and reliance of lower-income families on school counsellors, rather than parents or other family members, to provide information on college.(47)

**Interventions targeting hiring practices and procedures**

We found one primary study from Ontario that suggested hiring staff members who are culturally responsive and committed to working within school communities based on students’ academic and social needs, rather than hiring based on seniority (as per Ontario Regulation 274) could help to reduce gaps in education achievement.(41)

**District-level interventions**

We found one non-systematic review that compared the implementation of different education policies across districts and regions in the U.K. The comparative review found that efforts to increase the number of students attending grammar schools (i.e., schools requiring high scores on a standardized entrance exam taken at age 11), including students from lower socio-economic statuses, in districts of Northern Ireland did not dilute the quality of education.(48)

Evidence >> Insight >> Action
System-level interventions

We found one overview of systematic reviews, three systematic reviews, two non-systematic reviews (including one jurisdictional scan across OECD countries) and two primary studies examining system-level interventions. These interventions can be grouped according to four categories: 1) early childhood development services and pre-primary education; 2) assessment practices and grade repetition; 3) revenue streams and financial incentives; and 4) streaming.

Early childhood development services and pre-primary education

We found evidence on the impact of early childhood education (ECE) on children from low-income and minority families based on one recent low-quality systematic review and the jurisdictional scan of OECD countries.

The recent low-quality review found that centre-based ECE programs prior to enrolment in kindergarten improved students’ standardized-test scores throughout their educational career, however with a declining effect size over time. The systematic review found other benefits from ECE to include: improvements in high-school graduation rates; creation of additional work time for caregivers; and increased family income. The review noted that one possible harm of ECE was a loss of recreational and family time for the child.

The jurisdictional scan suggested that ECE has been linked to improvements in children’s well-being, reductions in poverty, increases in social mobility, improvement in women’s participation in the labour market, improvements in fertility rates, and better social and economic development. Generally, evidence suggests that to ensure long-term benefits from ECE, systems should focus on targeting the quality and training of teachers and staff and setting goals that focus on children’s cognitive skills.

Further, the jurisdictional scan of OECD countries noted that most countries that have worked to improve their early childhood education programs have done so through broad strategies implemented at the government level. These policies have aimed to improve access to early childhood education, for example through providing funding (often for the most disadvantaged) for children to attend programs in the case of Poland, Turkey and Australia, or by setting out broad policies that contain guiding principles for the development of local policies in the case of Canada. Other jurisdictions such as Finland and Korea have developed national curriculums for early childhood education that are aligned with the primary school to set children up for success at later levels of education. Finally, almost all OECD countries have implemented a monitoring system to assess early childhood development and identify learning needs, such as in Australia, which has put in place the Early Development Index to provide an understanding of children’s development before they reach school.

Assessment practices and grade repetition

We found one overview of systematic reviews, one non-systematic review and one primary study focused on assessment practices and the use of assessment data. In addition, we have included information from a jurisdictional scan of OECD countries on the use of grade repetition on equity and quality of education.

One overview of systematic reviews examined the use of large-scale assessments to develop education policy in economically deprived areas, and found that policymakers were most often using information from large-scale assessments to inform curriculum updates. However, there was little evidence that this information was being used to inform policies targeting specific teaching and learning practices. The overview of systematic reviews found that factors influencing the use of large-scale assessment data include the relationship between an assessment agency and governmental education agencies, as well as the media and public opinion.
One primary study conducted in Alberta examined the significance of fairness and equity in assessment practices, and stakeholders’ beliefs and attitudes about student assessment. Study findings revealed five key principles to promote fairness and equity in student assessment practices:

- educators must strive to address the personal impact of assessment practices on students and their families;
- assessment must be differentiated to accommodate the ability, social, cultural and linguistic backgrounds of students;
- all members of school communities must challenge the complacency associated with accepting indefensible assessment practices;
- the frequency, intensity and intrusiveness of assessments must not be overwhelming for students and their families; and
- assessment must not be used to counter inappropriate student behaviour or reward desired behaviour.(52)

The jurisdictional scan of OECD countries found that while grade repetition aims to raise student outcomes, evidence suggests that it does not improve results and is costly to education systems.(50) The jurisdictional scan also suggested two policy options that had been implemented in other regions:

- reduce the use of grade repetition to exceptional cases and implement assessment at the end of a learning cycle rather than at the end of the school year; and
- implement alternatives to grade repetition by developing remedial tools for schools.(50)

**Revenue streams and financial incentives**

We found mixed evidence from two medium-quality systematic reviews, three non-systematic literature reviews (including a jurisdictional scan of OECD countries) and one primary study on the impact of changes to revenue streams and other financial incentives on equity and quality of education.

One non-systematic review compared school expenditures across districts in the United Kingdom and found that increasing school expenditure improves student attainment, especially for disadvantaged groups, and may help to reduce inequality in educational outcomes.(48)

Mixed evidence was found for the use of block grants and resource investments in particular schools, with one medium-quality systematic review finding that block grants and investments in the physical infrastructure of a school tended to increase enrolment, but did not impact learning outcomes.(53)

Two non-systematic reviews also found mixed evidence on implementing school choice to instil competition between schools (which are paid on a per capita basis) to improve the quality of education. One of the non-systematic reviews noted that while some improvements have been seen, measuring school quality is often difficult, and implementing incentives for parents to choose schools may result in a focus on the improvement of reported indicators while neglecting other aspects of quality that are not publicly reported.(48) The jurisdictional scan also suggested that unsupported school choice could hinder equity advancements, and provided three possible policy options to manage these negative impacts:

- prohibit selection into primary schools based on income and performance;
- limit the ability of schools to expel low-performing students; and
- increase the number of publicly funded independent schools.(50)

In terms of incentives for students, one older low-quality review found that financial incentives to improve attendance increased participation, retention, attendance and academic achievement among disadvantaged ethnic minority students over the age of 16.(33)
We found evidence on the use of streaming (or tracking) of students from one primary study and from the jurisdictional scan of OECD countries.

The jurisdictional scan noted that early tracking can reduce gains in equity. This finding was supported by the primary study conducted in Quebec, which found that early mathematics tracking in secondary schools leads to negative consequences. The study shows that students whose parents have low educational capital and students who are less successful in high school opt out of mathematics earlier, and limit access routes for higher education later on.

The jurisdictional scan noted that to reduce the impact of early tracking the age of tracking should be raised, and comprehensive education should be provided to all by merging existing tracking pathways wherever possible.

**Overview of recent reforms in select OECD countries**

To complement the findings above, we have included additional findings from the jurisdictional scan of OECD countries, comparing recent reforms to improve the equity and quality of education. The jurisdictions included were chosen either for being other Anglo-Saxon countries (i.e., Australia, New Zealand, United Kingdom, United States) or were European countries that the requestor expressed a particular interest in (i.e., Finland and Germany). Targeted searches were undertaken to compliment the findings from the OECD report with publicly available evaluations on the results of the highlighted policies (see Table 2). General findings from the jurisdictional scan have been summarized below, with Table 2 providing more detail on specific jurisdiction’s reforms.

Generally, to address inequities across schools, many jurisdictions have implemented either general policies or targeted programs tailored to specific groups. Comprehensive policies to support students include:

- developing priority educational regions which use multi-dimensional interventions to support groups of low socio-economic students;
- school support strategies which focus on providing pedagogical and technical support to low-performing schools; and
- providing additional funding to schools to improve the achievements of low socio-economic students.

Targeted programs implemented in OECD countries have mostly focused on immigrant communities and have included:

- implementing specific curriculum (differentiated by age, learning capabilities and background) to be completed after immigrating, but prior to entering mainstream schools; and
- development of broad policies to promote inclusive learning environments.

Finally, in select jurisdictions, targeted programs have been introduced to support ethnic minorities who have been underperforming compared to the general population. These policies have included:

- adapted curriculum that is taught in Indigenous languages (e.g., for Maori peoples in New Zealand) and incorporates Indigenous topics and culture into the curriculum;
- teaching cultural competencies for teachers in early childhood education, primary and secondary schools; and
- policies aimed at promoting the social and cultural capital of areas inhabited by ethnic minorities and hard-to-reach populations (e.g., Indigenous communities; Roma communities in Europe; recent immigrants and refugees).

<td></td>
<td>Closing the gap: Indigenous Early Childhood Development</td>
<td>Targets early learning, support for Indigenous families, and improved health for mothers and their children. Has worked to establish a network of 38 Children and Family Centres, which offers integrated early childhood and parenting services.</td>
<td>Significant gains were made in the proportion of pregnant Indigenous women with antenatal contact in the first trimester of pregnancy, with a rise from 60% to 66% between 2007 and 2010 across three jurisdictions (where data was available). In addition, a 55% decline in infant mortality was observed among Aboriginal and Torres Strait Islander infants between 2001 and 2011. Hospitalization rates for Indigenous children (0-4 years old) significantly increased from 2004-05 to 2010-11, however this may be reflective of improvements in access and demand for hospital treatment in this population. Despite improvements in other areas, Indigenous children continue to be under-represented in preschool enrolment and attendance. (55)</td>
</tr>
<tr>
<td>Australia</td>
<td><strong>Primary and secondary schools</strong></td>
<td></td>
<td>Aboriginal and Torres Strait Islander Education Action Plan</td>
<td>It identifies outcomes, targets and performance indicators, and national, systemic and local actions in six priority domains that evidence shows will contribute to improved educational outcomes among Aboriginal and Torres Strait Islanders and the non-Indigenous population.</td>
<td>Throughout the three years of implementation, retention rates and grade progression ratios improved, though there remains variations between Indigenous and non-Indigenous populations as well as between jurisdictions. Many schools report that the action plan helped to establish the foundations for literacy and numeracy improvement. At a national level however, only three of eight literacy and numeracy targets were met in 2013 (at the end of the action plan’s implementation), fewer than were achieved in either 2011 or 2012. The focus on trade training over the course of the action plan’s implementation helped to provide pathways for post-school options. It is thought that a greater emphasis on pre- and post-school options outside of the trades could have had additional benefits for students. Sustainability of practices implemented as a part of the action plan are likely to experience an impact from high rates of teacher turnover. (56)</td>

Low-Socioeconomic Status Communities

The money resulted in the implementation of a variety of initiatives including: coaching and mentoring; professional learning opportunities; case management; personalized learning plans; community partnerships; whole-school planning; professional-learning teams; collection and use of data; and parental-engagement efforts.

The results of the evaluation found a small but significant association between the policy implementation and growth in student achievement in numeracy from 2009 to 2011, in years 3, 5, 7 and 9. A reduction in achievement in reading was observed over the same time period. This data is taken at a national level and cannot be considered causal.

Generally, mixed results were found for the effects of the policy. Greater achievements were observed for numeracy scores compared to literacy, in partnership schools located in metropolitan areas, and among larger (greater than 400 students) partnership schools. Across most measurements greater improvements were observed among non-partnership schools with similar baseline levels in numeracy and reading, than among partnership schools. These trends differ significantly by region.

Significant improvements were noted among Indigenous students who exhibited above-average growth in partnership schools compared to students at similar non-partnership schools. Further, improvements in school engagement were noted among Indigenous students at partnership schools, with significant improvements noted as a result of case managing and individual targeted support.(57)

Government Early childhood education and care

Australian Early Development Index

Population-based measure of how children have developed by the time they start school and can be used to assess and track the success or failures of policies.

Index has been used twice since 2009 to collect data on health, maturity, social competency, knowledge and language on 96.5% of Australian children in their first year of schooling.(50)

</tbody>
</table>

The legal increase triggered a significant expansion in services, whereby from 2008 and 2014 the percentage of children up to age 3 who were enrolled in early childhood education increased from 12.1% to 27.4% in Germany, and from 41.9% to 54.0% in eastern Germany. A report by the European Commission identified the following features as leading to success in the policy:

- targeted financial investments by the federal, state and municipal governments;
- careful monitoring of progress;
- monitoring of those children enrolled in early childhood education; and
- regular surveys on the demand for early childhood education from parents. (58)

One study conducted in the German state of Hessen found positive effects for reading results of children whose parents are unemployed and for first generation immigrants in groups that are tracked at a later point. Similarly, effects seem to be especially high at the lower end of the test score distribution, suggesting that later tracking may decrease education inequality. (59)

| Region | Pasifika Education Plan | Developed to increase accountability for Pasifika students’ success and make improvements in practice. The plan focuses on the use of achievement information monitored annually. | Progress report from 2015 found:  
- increase in the proportion of children enrolling in early childhood education before enrolling in school, however Pasifika populations continue to have the lowest level of participation of all ethnic groups;  
- proportion of early childhood education being taught in Pasifika languages has remained relatively constant;  
- small increase in the number of children accessing early intervention services;  
- increase in the number of Pasifika students meeting literacy and numeracy requirements, however a significant gap still exists;  
- increase in Pasifika 18-year-olds achieving a level two qualification or equivalent; and  
- significant decreases in suspension and exclusion rates among Pasifika students. |
| Government | Primary and secondary | National Standards for Maori-medium education | Introduced in years one to ten to support schools and students using the national curriculum for Maori-medium education. They establish national standards | An evaluation of the implementation of national standards revealed that:  
- an increasing proportion of schools included targets in their charters that address student achievement;  
- national standards were increasingly differentiated to accelerate the progress of specific groups throughout the standards implementation; |
### Evidence >> Insight >> Action

| Government (adapted and implemented by individual schools) | Primary and secondary | New Zealand Curriculum for Maori Medium Schools | National curriculum which outlines outcomes, values, principles, key competencies, learning areas and achievement objectives to guide teaching and learning. Schools adapt the curriculum to fit the individual needs of the students in the class. | • most schools used baseline data to inform their National Standards targets and focused on students who were ‘below’ or ‘well below’ the standards;  
• the proportion of schools that collated National Standards achievement data increased from 2011 to 2014, with the majority of schools tracking the progress of individual students in relation to the standards;  
• teaching interventions both within the classroom and external to the classroom where provided;  
• small increases in the proportions of students rated ‘at’ or above the reading, writing and mathematics standards have been observed in the five years of implementation; and  
• improvements in reading, writing and mathematics among Pasifika students in year seven and eight as well as among students at low-decile schools. (61) |

</table>

The number of converter academies has grown to 445. Attainment among the high-performing converter academies remained above the national average for state-funded schools, with 84% of students in primary converter academies achieving a level four or above. In secondary converter academies, 64% achieved five or more A-C grades on their GCSE compared to 56% in mainstream schools.

In addition, 305 sponsored academies were opened in 2014-15, bringing the total to 1,423 as of July 2015. The sponsored primary academies that have been open for two years have seen the proportion of pupils achieving a level four or above in reading, writing and mathematics improve by 10%. While some gains were made at the secondary-school level, they are not on par with the improvements observed at the primary-school level.

Specifically for vulnerable and disadvantaged pupils, results from sponsored academies improved at a faster rate than those in mainstream schools. Results for students with special educational needs and for those eligible for free school meals were significantly higher than in sponsored academies when compared to other mainstream schools. (66)

APPENDICES

The following tables provide detailed information about the systematic reviews and primary studies identified in the rapid synthesis. The ensuing information was extracted from the following sources:

- systematic reviews - the focus of the review, key findings, last year the literature was searched, the proportion of studies conducted in Canada and the proportion of studies focused on equity in education; and
- primary studies (including, economic evaluations and costing studies) - the focus of the study, methods used, study sample, jurisdiction studied, key features of the intervention and the study findings (based on the outcomes reported in the study).

For the appendix table providing details about the systematic reviews, the fourth column presents a rating of the overall quality of each review. The quality of each review has been assessed using AMSTAR (A MeaSurement Tool to Assess Reviews), which rates overall quality on a scale of 0 to 11, where 11/11 represents a review of the highest quality. It is important to note that the AMSTAR tool was developed to assess reviews focused on clinical interventions, so not all criteria apply to systematic reviews pertaining to delivery, financial or governance arrangements within health systems. Where the denominator is not 11, an aspect of the tool was considered not relevant by the raters. In comparing ratings, it is therefore important to keep both parts of the score (i.e., the numerator and denominator) in mind. For example, a review that scores 8/8 is generally of comparable quality to a review scoring 11/11; both ratings are considered “high scores.” A high score signals that readers of the review can have a high level of confidence in its findings. A low score, on the other hand, does not mean that the review should be discarded, merely that less confidence can be placed in its findings and that the review needs to be examined closely to identify its limitations. (Lewin S, Oxman AD, Lavis JN, Fretheim A. SUPPORT Tools for evidence-informed health Policymaking (STP): 8. Deciding how much confidence to place in a systematic review. Health Research Policy and Systems 2009; 7 (Suppl):S8).

All of the information provided in the appendix tables was taken into account by the authors in describing the findings in the rapid synthesis.

<tr>
<td>Systematic review</td>
<td>Evaluate interventions that seek to increase the participation and retention of disadvantaged ethnic minority students in post-compulsory education (33)</td>
<td>Fourteen intervention studies were identified. The review determined that financial incentives, which improved post-16 participation, retention, attendance, and academic achievement, was the only intervention close to being rolled out and implemented. Non-parental adult mentoring was also identified as a promising strategy that can improve pupil behaviour, academic performance, and dropout rates. However, this intervention takes years to yield results. The review notes that both of these strategies can be adapted for other contexts beyond the United States. The review also found several other interventions, but determined they had limited generalizability, or that the evidence for them was insufficient. These included monitoring of school engagement, supportive personalized environments, de-tracking and heterogeneous streaming, motivational and academic skills training, and academic and social support. The review concludes that given funding limitations, investment should be focused on designing and implementing financial incentives or mentoring programs.</td>

</tr>
<tr>
<td>Systematic review</td>
<td>Evaluate interventions that aim to improve educational outcomes for looked-after children and young people (LACYP) (32)</td>
<td>LACYP are less likely to complete primary or secondary education, possibly due to experiences of instability, variable access to the educational system, weak family and social networks, and insufficient accountability and monitoring of academic outcomes. This review identified 15 studies evaluating 12 educational interventions for LACYP. Nine interventions (Kids in Transition, Head Start, different variants of Teach Your Children Well, Multidimensional Treatment Foster Care, Fostering Individualized Assistance Programme, and On the Way Home) demonstrated variable positive effects on several outcomes, including academic skills, homework completion, school attendance, suspension, and dropout rates. No interventions demonstrated improvements in academic achievement, grade completion, school behaviour, or academic attitudes. The insufficiency of theoretically-driven interventions, the lack of scientific rigour, the small sample sizes, and the variable methodological quality limited the ability of the authors to evaluate bias and draw definitive conclusions about the relative effectiveness of the interventions. Additionally, questions remain about the extent to which interventions can be modified and customized without a loss in effectiveness. The review concludes that study designs must be strengthened in order to compare the effectiveness of these interventions.</td>

<td>Systematic review</td>
<td>Examine the effects of school-based health centres (SBHCs) on health and educational outcomes (38)</td>
<td>SBHCs aim to promote health and educational equity by increasing access to medical care among disadvantaged populations. Forty-six studies were identified. The review found that SBHCs are associated with substantial educational benefits, such as reductions in rates of suspension and non-completion, and increases in grades and grade promotion. SBHCs also improved student academic expectations, safety and respect, school engagement, and awareness of responsibility for their health. Health benefits included increases in the use of preventive services, and reductions in symptoms and incidents of asthma. There were also substantial reductions in emergency-department visits and hospital utilization for all conditions. In terms of reproductive and newborn health, contraceptive use increased among females, childbirth rates decreased, and prenatal care improved. SBHCs that offered more services and increased hours saw greater improvements. Other potential benefits of SBHCs include increased parental work times, and reduced child care and transportation costs. SBHCs also help connect families with social-assistance programs like Medicaid. While some papers raise concerns that SBHCs may fragment a child’s healthcare, increase sexual activity, and undermine parental authority over medical decisions for their children, the review found no evidence to back up these concerns. Limitations to the review include the lack of randomization within studies, a deficiency of true baseline data, and the potential influence of confounders and effect modifiers like the presence of other community health resources. Despite these limitations, the paper concludes that SBHCs are a viable way to advance health equity.</td>

Systematic review

Assess out-of-school-time academic (OSTA) programs for at-risk students (37)

OSTA programs are voluntary programs with an academic component, which can take multiple forms, such as supervised time for students to complete their homework, or intensive tutoring. The review found 57 studies. Subject-specific programs were more effective than general or minimal academic programs, but general programs affected achievement in more than one subject. Reading-focused programs were only effective up to third grade. OSTA programs offered during the summer were more effective than programs offered during the school year. There was insufficient evidence demonstrating the effectiveness of OSTA programs on behavioural and longer-term academic outcomes. The review was also unable to provide a cost-effectiveness or cost-benefit assessment. Though the studies were conducted in the United States, the authors suggest that results may be transferable to other high-income nations with similar educational systems and achievement gaps. However, it should be noted that the impact of the OSTA programs on academic achievements for rural, middle- and high-SES, and non-black populations is unclear. The applicability of results to middle and high school populations is also uncertain. The paper concludes that despite evidence for their effectiveness, OSTA programs are unlikely to be sufficient by themselves to close the achievement gap or overcome health disparities. OSTA programs must be supported by educational, community, and family environments, and other initiatives in order to yield long-lasting changes.

Systematic review

Evaluate the effectiveness of centre-based early childhood education (ECE) programs (49)

Children from low-income and minority families experience obvious delays in development by the age of 3. This has long-lasting effects on educational achievement, which is a social determinant of health. Centre-based ECE programs are designed to close this gap by improving the cognitive and social development of children prior to kindergarten enrolment. Three types of ECEs were examined in this review: state and district programs, federal Head Start programs, and model programs like Perry preschool and Abecedarian programs. It was found that centre-based ECEs improve educational and health-related outcomes for low-income and minority children in high-income economies. Its effects on standardized test scores persisted after program completion, but with declining effect sizes over time, perhaps because post-ECE educational quality is an important effect modifier. The most rapid decrease happened immediately after the end of the program, and slowed in later years. All three program types were effective in different manners. Significant benefits were found for all three program types on standardized achievement tests. Head Start programs showed statistically significant benefits for high school graduation. State and district programs had significant effects on self-regulation. There were also non-significant favourable effects for grade retention, assignment to

<td>Systematic review</td>
<td>Evaluate the effectiveness of prevention and intervention programs aimed at primary and secondary school students in reducing school dropout rates (35)</td>
<td>The 167 included studies covered a wide variety of program types, including attendance monitoring, case management, skills training and community service. No single program type stood out as significantly more effective than the others. Some programs catered to a general population whereas other programs specifically targeted teen parents. General programs effectively reduced dropout rates, with a mean odds ratio of 1.72. However, there was considerable variability between programs, with programs that experienced implementation problems having significantly smaller reductions in dropout rates. Classroom-based programs and mixed-setting programs produced better outcomes than community-based programs, but it is difficult to determine whether this is due to the setting or due to the program type as the two are heavily correlated. Less frequent programs were generally more effective, possibly because more frequent programs have more variability in program delivery. Demographics had minimal influence on effectiveness, and programs that were tailored to specific age, racial or ethnic groups did not fare significantly better. The teen parent programs had favourable odds ratios of 1.83 for dropout rates and 1.55 for school enrolment outcomes. Implementation quality was once again an important determinant to their effectiveness. The review was unable to synthesize cost-benefit information. There was no strong indication of the presence of publication or small-study biases. Given the similar effectiveness between the program types, the authors of the review recommend that school administrators and policymakers choose a strategy appropriate for their particular circumstances. It is also crucial to focus on implementation quality to maximize effectiveness.</td>

### Systematic review

Examining pre-service teachers' values and beliefs of social justice (31)

The review focused on 23 studies that emphasize the increased use of social justice as a theme in education research. The systematic review found that generally, there is a lack of empirical evidence on the effects of interventions focused on promoting social justice.

The evidence from the systematic review can be divided into four themes: 1) understanding of social justice and attitudes to diversity; 2) changes in beliefs; 3) field experience and service learning; and 4) innovations and challenges in teacher education.

Generally, the studies found that teachers had mixed levels of understanding of social justice when entering practice, with one large study finding that pre-existing attitudes and values towards social justice would not support teachers working in diverse classrooms. The review reported on one study which found three dispositional factors that may determine whether teachers adopt multicultural awareness: self-awareness and self-reflectiveness; openness; and commitment to social justice.

The studies that focused on changes in beliefs drew a range of conclusions about whether and how teachers' understanding of social justice could or did change over time. Two studies concluded that teacher education programs with a social justice agenda can improve positive dispositions.

Studies examining field experience and service learning found that using experiential approaches to learning combined with reflective tasks are the most effective interventions for pre-service teachers' understanding of and approaches towards social justice.

Studies focused on innovations found that those interventions that placed social justice at the centre, either through curricular or pedagogical focus, were successful. The review highlighted the importance of collaboration between students working within courses or programs to achieve social justice aims.

Overall the review noted the need for research, notably on the effects of improving social justice approaches to teaching on students in diverse classrooms.

<td>disadvantaged populations (68)</td>
<td>systematic review increased high school graduation by 8%. However, in the three programs evaluated by randomized controlled trials, the difference in impact was not statistically significant. The review also found that college access programs increase college enrolment by 12%. Randomized controlled trials found a smaller, but still statistically significant positive difference of 4%. Due to the sharp differences between the results of the randomized controlled trials and studies with a quasi-experimental design, results from the latter type of studies must be interpreted carefully. The authors also caution against drawing strong conclusions given that the results are still preliminary. Nonetheless, one thing of note is that measures of completed coursework are the best pre-college predictors of college graduation, and should be incorporated in evaluations of college access programs.</td>

<tr>
<td>Systematic review in progress</td>
<td>Compare the effectiveness of various centre-based, classroom-style early childhood education (ECE) programs in improving the development and achievement of low-income children (69)</td>
<td>There is much debate and contradicting evidence regarding the effectiveness of ECE programs. Some studies show lasting benefits in educational attainment, employment and earnings, and reductions in criminal behaviour and out-of-wedlock births. Other interventions show insignificant or fading effects, suggesting that other factors like neighbourhood and family are more important to a child's development. The main goal of this review is to determine the effectiveness of different ECE programs. This review will also answer questions regarding potential effect modifiers, the most appropriate outcomes for measuring effectiveness, how large of an effect size a program should aim for, and the generalizability of research. A search of existing reviews (literature, systematic, etc.) revealed about 800 reviews relevant to ECE. The included studies in the reviews were often cherry-picked, resulting in biased reviews either for or against ECE programs. Systematic reviews that looked at ECE were generally published before 2004, and therefore did not include large-scale evaluations of noteworthy and important programs like the Head Start program. More recent systematic reviews had more focused objectives, or employed a meta-analysis approach without evaluating the quality of the methodology of included studies. The authors will be guided by standards in the What Works Clearinghouse's Procedures and Standards Handbook and Evidence Review Protocol for Early Childhood Education Interventions. The authors plan on including studies of different methodologies, including comparisons-to-self/inter-temporal comparisons, econometric evaluations, comparison groups, and instrumental variable designs.</td>

<td>Systematic review in progress</td>
<td>Examine universal and school-based education programs that aim to reduce ethnic prejudice and promote respect for diversity among children aged 3-11 (70)</td>
<td>Research has consistently demonstrated that children begin to display ethnic prejudices at around the age of 3. This systematic review will look at universal school-based interventions delivered at a class level with specific objectives to reduce ethnic prejudices and/or promote respect for diversity among children aged 3-11. Other explored topics include the effect of program characteristics and participant demographic factors on efficacy, and the relationship between ethnic prejudice and respect for diversity. The authors found that existing reviews tended not to be systematic or use meta-analytic techniques. Many reviews were also limited in that they did not focus specifically on education, focused on only one particular intervention technique, used more general</td>

<td>Systematic review in progress</td>
<td>Evaluate the effect of “No Excuses” charter schools on math and literacy achievement in primary and secondary education (71)</td>
<td>“No Excuses” charter schools are typically found in inner city neighbourhoods, and are characterized by high academic expectations, strict discipline, longer academic calendars, and intensive tutoring. While studies of individual charter school networks have found evidence supporting the efficacy of “No Excuses” charter schools, no systematic reviews have been conducted yet on this topic. The review intends to evaluate the effects of “No Excuses” charter schools on academic achievement and racial- and income-based gaps, and determine the limitations to existing evidence. The review will also examine potential modifiers to effectiveness. Included studies must either employ a random assignment method or have a quasi-experimental design. Studies must also report student-level data, literacy or math achievement, and baseline equivalence. Searches for published and unpublished literature will be conducted through electronic databases, internet search engines, citations in previous reviews, citations in research reports, conference listings, hand searches of relevant journals, and correspondence with experts. Retrieved studies will be independently screened and coded. The Cochrane risk-of-bias tool will be used to assess RCTs. All estimated mean differences will be converted with Hedges' g and outliers removed. Q, Tau², and I² will be used to assess heterogeneity, and funnel plots for publication bias. In anticipation of the heterogeneity across included studies, a random effects meta-analysis approach will be used. Grand mean effect sizes will be calculated separately for experimental and quasi-experimental studies, for math and literacy outcomes, and by follow-up timing of outcome measurement. All analysis will be performed through Stata. Mixed-effects meta-regression models will be used to explore the effect of moderator variables. Sensitivity analyses will also be conducted to investigate the robustness of results.</td>

---|---|---|---|---|---
Non systematic review | Discuss the use of large-scale assessments in the development of education policy in economically developing countries and in countries of the Asia-Pacific (51) | Large-scale assessments assess the quality of education systems by examining education system outputs, like student learning outcomes. With the recent shift toward evaluating education quality and equity, and the global adoption of evidence-based policymaking, the use of large-scale assessments to inform the development of best-practices models has increased internationally. This paper explores how results from large-scale assessments are being used to inform policymaking in education. The paper draws upon 103 documents from two previously conducted systematic reviews. Overall, policymakers most frequently use large-scale assessments during curricular policy reform or during the establishment or reform of assessment and evaluation systems. There was little evidence that large-scale assessments were being used to inform policies targeting specific teaching and learning practices. The paper also found little research examining the use of large-scale assessments in low- and middle-income countries. Factors influencing the use of large-scale assessment data include the relationship between a country’s assessment agency and governmental education agencies, and the credibility and standing of the assessment agency. The media and public opinion can also catalyze policymakers to respond to and consider large-scale assessment results in education reform. However, the media can also sometimes play a negative role by pushing for ineffective or harmful education policies. | N/A | No rating tool available for this type of document | N/A

| Non systematic review  | Examine how high school counsellor-student interactions can improve post-secondary outcomes of college preparation and enrolment (47) | The paper was unable to delve deeply into the specifics of the policymaking process. The authors suggest that further research could examine case studies closely in order to further clarify the relationship between large-scale assessments and the use of assessment data in education policy reform.  
  **Social context**  
  School counsellors often experience role confusion due to their many diverse responsibilities, which include registration, crisis counselling, and handling disciplinary problems. Additionally, research suggests that pre-service education programs for school counsellors do not adequately emphasize preparation for college counselling. Inadequate funds can also prevent the hiring of enough school counsellors. The paper suggests that counsellors would be able to work more effectively if given a more explicit definition of their roles and duties, and recommends that future research focus on understanding the impact of larger national, state or district-level factors on the high school counsellor-student relationship in college preparation.  
  **School context**  
  Two organizational challenges hinder the effectiveness of student counsellors: the student-to-counsellor ratio; and the time available each day for college counselling. These factors must be considered together, as there is no relationship between counsellor ratio and college enrolment of students when considered alone. Research also demonstrates that starting college prep in the ninth grade and increasing collaboration between counsellors and the rest of the school community can yield beneficial post-secondary outcomes. On the other hand, inadequate college resources, whether physical (e.g., brochures) or intangible (e.g., knowledge of different programs) can hinder post-secondary outcomes. The paper also identifies access to a rigorous curriculum as being an especially important resource, as it often influences factors, like GPA and admission test scores, that are heavily considered for college admissions. More research that carefully isolates the aforementioned factors is needed in order to determine which factors are most influential.  
  **Family context**  
  Family is an important determinant of social capital. Social capital often translates to human capital, like skills and knowledge, and predicts college enrolment. While students from higher-income families are more likely to rely on their parents for knowledge,                                                                 | N/A                                 | No rating tool available for this type of document                                                             | N/A                                  |

<tr>
<td></td>
<td>School type</td>
<td>Northern Ireland employs a “selective system” in which pupils are separated by ability into different school types at the age of 11. Evidence shows that increasing the number of students who can attend grammar schools, which are for higher-performing students, does not dilute the quality of education. England has an academies scheme, which initially targeted pupil under-achievement in deprived areas. The scheme aimed to replace failing schools with brand new schools that had autonomy over decision-making. However, this program has expanded so that any academy can now opt out of local authority control, and now is seen as a general school improvement strategy. While some evidence suggests that student performance increases within academies, it is too early to evaluate the impact of the new general model.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Choice and competition</td>
<td>England differs from other countries by relying more on incentives and school choice to foster competition between schools. Some issues include the difficult task of measuring school quality. For instance, it is sometimes difficult to determine whether changes in school quality measures reflect real changes or random fluctuations. Measuring school quality may also encourage behaviour designed to look good on actual measures while neglecting other aspects of school quality that are not measured. There is mixed evidence on whether increased competition and increased school choice improves educational attainment.</td>

<td>Evaluate school-based interventions that seek to improve the mental health and social-emotional functioning of students who are refugees or asylum speakers, or have war trauma (39)</td>
<td>Thirteen studies were found. Three types of interventions were identified: cognitive behavioural therapy; creative expression; and multi-tiered or multi-modal models. Generally, the review found that school-based interventions may be effective at reducing trauma-related symptoms and impairment. Creative-expression interventions, which allow individuals to express and process feelings through a creative outlet, were most commonly used, but yielded the least consistent results. These interventions also tended to be costly, as the programs often relied on specially-trained therapists. In multi-modal interventions, the treatment is determined by the severity of the student's needs, and may consist of group interventions, family therapy, individual therapy, or in-home services. These interventions yielded mixed results, and may not be practical for schools hoping to implement services internally, as they often relied on clinicians from outside agencies. Cognitive behavioural therapy, which promotes healthy thinking and behavioural patterns, had more consistent results, but was also most often administered by external clinicians.</td>

<tr>
<td>Non systematic review</td>
<td>Examine the role of schools in communities of low socio-economic background (73)</td>
<td>This paper elucidates the actions taken by schools and communities in order to address community-level disadvantages, and summarizes perceptions surrounding these actions (in particular, their purpose, and who holds power to act). Most studies were based in the U.K. or the U.S. Four types of school-led action were found: schools as providers of services and facilities; schools as developers of communities' social and civic capacity; schools as engines of area regeneration; and schools as developers of community-responsive curricula and pedagogy. Four types of community-led actions were found: the exercise of school choice by parents; the involvement of the community in school governance; the organizational role of community in promoting educational reform; and the role of communities in establishing schools. Actions can be analyzed through a social stance dimension, which determines the degree to which actions work within or transform existing societal arrangements. Actions can also be analyzed through a power and control dimension, which determines whether those with power (defined as those who set the agenda, whose interests are being served, and who can start or stop action) are situated within or outside of the community. Professionals, or powers exogenous to the community, working within existing arrangements appear to be in the best position to have a positive impact on disadvantages at the community level. As such, this review found that existing literature tended to focus on the decisions and performance of educational professionals rather than the community, and aligned with existing societal arrangements. This reflects how difficult it is for schools and disadvantaged communities to influence wider societal structures. The review calls for more research on community perspectives on the schools' role in mitigating community disadvantage, on determining how local actors exercise their power, and on examining how multiple agendas pan out simultaneously. There is also a lack of comparative research that could help define the generalizability of study results. The review concludes that in order to promote transformative action, there needs to be more</td>

dialogue and agenda alignment between professionals and communities, and between local, regional and national authorities.

Non systematic review

Provide recommendations for successful education reform and compare policy trends across different countries of the Organisation of Economic Co-operation and Development (OECD) (50)

The report examines 450 educational reforms adopted by OECD countries from 2008 to 2014.

There is considerable variation across countries on how money earmarked for education is allocated, and the outcomes it produces. About 16% of the examined recent reforms focused on quality and equity in education. Twenty-nine per cent of reforms aimed to better prepare students for the future, through measures like improving the quality of vocational education, or increasing work-based training opportunities. Twenty-four per cent of reforms addressed school improvement, and more specifically, developing positive environments and retaining quality staff. Fourteen per cent of reforms developed or revamped evaluation and assessment tools and processes. Nine per cent of reforms addressed educational governance, either through refining roles and responsibilities, reorganizing institutional structures, or elaborating overarching visions for their system. Twelve per cent of reforms focused on funding arrangements, either at the system level, the institution level, or the individual level.

Reforms tended to be most effective if they had a coherent framework, and a sufficient capacity for conducting and interpreting evaluations at all relevant system levels. Successful reforms also concretely addressed specific, well-defined issues. The most effective policies were designed around student learning, building teachers’ capacity, and engaging stakeholders.

In order to improve educational quality, the report recommends that policies focus on changing classroom practices, balancing external pressure and support, and developing long-term objectives. Additionally, only 10% of included reforms were evaluated following their implementation. The report identifies this as an area of opportunity as consistent measurement and follow-up is essential for developing successful policies in the future, and therefore is also likely to be cost-efficient in the long run.

<td>Examine the effects of a leadership course designed for immigrant secondary school students learning English as an additional language with a social justice orientation (74)</td>
<td>Qualitative analysis of teacher’s plans and notes, course assignments, ongoing informal conversations with students, artefact analysis, video footage of students presenting a conference workshop, and monthly feedback forms</td>
<td>2016</td>
<td>One Grade 11 English as a second language (ESL) Leadership class and their teacher</td>
<td>Ontario</td>
<td>A leadership course designed for immigrant secondary school students learning English as an additional language with a social justice orientation (Leadership and Peer Support, Grade 11, Open)</td>
<td>Findings revealed that each strand of the ESL Leadership course was strengthened because the teacher adopted the stance of a guide and facilitator, and that the students responded positively by taking responsibility for shaping the course. Students were also more engaged cognitively and affectively because their teacher invited them to share their past experiences and express their opinions on nearly every aspect of the course. The increased level of confidence reported by students grew from the many opportunities they had to interact with people from both their home culture and other cultures, and the related opportunity to debrief these interactions with their teacher in a supportive and inclusive environment. The ESL Leadership course allowed for the more equitable distribution of power amongst students in the school by providing opportunities for English-language learners to take on new roles and interact with a range of people they would not normally meet or interact with, including their Canadian-born peers. The ESL Leadership course included opportunities for students to develop a consciousness of self while collaborating for a common purpose leading to a sense of citizenship growing from their experience as emerging socially responsible leaders.</td>

<tr>
<td>Examine the effects of Peer Assisted Learning Strategies (PALS) to supplement classroom reading instruction (30)</td>
<td>Pre- and post-tests based on several measures (Curriculum Base Measurements, WIF, Developmental reading assessment)</td>
<td>2017</td>
<td>All first-grade students from the school district’s 15 elementary schools (n= 436 students including 234 boys and 202 girls)</td>
<td>Ontario</td>
<td>PALS is a class-wide peer tutoring program that is implemented by classroom teachers (30 –40 minutes, three days a week) for all students as a supplement to existing literacy instruction aiming to improve reading achievement</td>
<td>Findings indicate that compared to previous years, when PALS was not used, students in this study made significantly greater gains in reading scores. Boys made similar gains to girls, Aboriginal students made similar gains to non-Aboriginal students, and at-risk students closed the achievement gap slightly with their typically achieving peers. For students who did not make adequate progress in reading throughout the year, the data indicate that the best predictor of at-risk status by the end of first grade was not a student’s sex or Aboriginal status, but the ease with which he or she could effortlessly identify the sounds of letters and read words on entering the first grade.</td>

<td>Examine how principals employ culturally responsive leadership practices to shape school experiences of marginalized students (41)</td>
<td>Case study research and cross-case analysis were conducted between different samples of elementary principals employing different leadership practices</td>
<td>2016</td>
<td>Two administrators and five teachers from two public elementary schools who were purposefully selected</td>
<td>Ontario</td>
<td>Culturally responsive leadership</td>
<td>Students do not have control over factors such as socio-economic status, cultural background, race or language. However, these factors affect students’ abilities to succeed within the educational system. Leaders within school communities (i.e., principals and teachers) have a responsibility to mitigate the propagation of student marginalization. The study suggests that it is necessary for school leaders to hire staff members who are culturally responsive and committed to working within school communities based on students’ academic and social needs. Ontario Regulation 274, however, mandates that new teachers be hired based on seniority, therefore jeopardizing this institutional priority. Education Quality and Accountability Office (EQAO) standardized testing was found to be both a poor measure of student achievement as well as an inequitable way of assessing student learning. EQAO assessments were found to be non-indicative of what students in culturally diverse and marginalized communities could accomplish with more culturally and contextually-appropriate models. Many study participants also concluded that students from culturally marginalized backgrounds are more engaged when taught in curricula that connect to their lived experiences or cultural backgrounds.</td>
